City of El Centro

2010 Urban Water Management Plan Contact Sheet

Date plan submitted to the Department of Water Resources:

Name of person preparing this plan:

David Dale, PE, PLS

Dynamic Consulting Engineers, Inc.

2415 Imperial Business Park Drive, Suite B

Imperial, CA 92251

Phone: **(760) 545-0162**

Fax: **(760) 545-0163**

E-mail address: **david.dale@dceinc.org**

The Water supplier is a: **Municipality, retailer**

Utility services provided by the water supplier include: **Water, Sewer**

Is this Agency a Bureau of Reclamation Contractor? **No**

Is This Agency a State Water Project Contractor? **No**

Introduction/Executive Summary

The Urban Water Management (UWMP) Act (California Water Code §10610 et seq.) requires urban water suppliers to report, describe, and evaluate:

- Water deliveries and uses
- Water supply sources
- Efficient water uses
- DMMs, including implementation strategy and schedule

In addition, the Water Conservation Bill of 2009 requires urban water suppliers to report in their UWMPs base daily per capita water use (baseline), urban water use target, interim urban water use target, and compliance daily per capita water use.

The Baseline base daily per capita water use (consecutive 10 year average) per day use is 193 gallons (2001-2010).

Year	DoF El Centro Population Estimates*	Gross Water Use - Water Pumped into the distribution system (Million Gallons)	Average Per Capita Per Day Use (Gallons)
2001	38,499	2,854.369	203
2002	38,833	2,879.611	203
2003	39,550	2,858.400	198
2004	40,047	2,931.460	201
2005	40,982	2,981.490	199
2006	42,116	3,153.160	205
2007	41,789	2,983.640	196
2008	43,316	2,943.706	186
2009	44,303	2,861.635	177
2010	45,365	2,621.240	158
Average	41,166	2,906	193

Figure 1 - City of El Centro Average Per Capita per Day Use (2001-2010)

*population estimates from the State of California Department of Finance

The 2020 City of El Centro Urban Water Use Target was calculated to be 190 gallons per capita per day (GPCD) using Method 3 in the *Guidebook to Assist Urban Water Suppliers to Prepare a 2010 Urban Water Management Plan*. This is further discussed on pages 40-44.

METHOD 3: 2020 City of El Centro Urban Water Use Target (95 percent of the 5 year average per capita per day use in gallons)	190
---	-----

Figure 2 - City of El Centro 2020 Urban Water Use Target

The Interim Urban Water Use Target for 2015 was calculated using the average of the 10 year Baseline base daily per capita water use shown in Figure 1 (194 GPCD) and 2020 Urban Water Use Target (190 GPCD):

Interim Urban Water Use Target for 2015 (average between the Base Line and Urban Water Use Target)	192
---	-----

Figure 3 - Interim Urban Water Use Target for 2015

The City's Urban Water Use Target for 2020 is **190** gallons per capita per day (gpcd). In 2010, the average was 158 gpcd. The City will be required to meet the goal of 190 gpcd by 2020 to be eligible for future state funding unless revised in the 2015 UWMP update.

The UWMP Act directs water agencies in carrying out their long-term resource planning responsibilities to ensure adequate water supplies are available to meet existing and future demands (CWC 10612 (b)). Urban water suppliers (see definition in Part II, Section P: Glossary) are required to assess current demands and supplies over a 20-year planning horizon and consider various drought scenarios.

The UWMP Act also requires that water shortage contingency planning and drought response actions be included in a UWMP. UWMPs are to be prepared every five years by urban water suppliers with 3,000 or more service connections or supplying 3,000 or more acre-feet of water per year. Public and private utilities with multiple service areas within their districts should follow the guidelines below.

- Public utilities above the UWMP submittal threshold should include all service areas regardless of size.
- For private utilities, if the district is above the threshold, then all the service areas

within that district should be included. If the utility district is below the UWMP threshold, an UWMP is not required for that district.

- One urban water use target should be determined for each UWMP.

The normal UWMP submittal cycle requires that they be prepared and submitted in December of years ending in five and zero. However, because of recent changes in UWMP requirements, State law has extended the deadline for the 2010 UWMP to July 31, 2011. Although submitted in 2011, 2010 UWMPs will be referred to as 2010 UWMPs because they include 2010 water data and to retain consistency with the five-year submittal cycle.

Based on legislative changes resulting from the November 2009 passage of SBX7-7 (hereafter referred to as the Water Conservation Bill of 2009), development of UWMPs will also enable water agencies and, in turn, the State of California to set targets and track progress toward decreasing daily per capita urban water use throughout the state.

An UWMP, including discussion of the status of a water supplier's implementation of DMMs, is required for an urban water supplier to be eligible for a water management grant or loan administered by DWR, the State Water Resources Control Board (State Water Board), or the Delta Stewardship Council (CWC §10631.5(a)). A current UWMP must also be maintained by the water supplier throughout the term of any grant or loan administered by DWR.

Changes to California law require that, beginning in 2016, water suppliers comply with water conservation requirements established by the Water Conservation Bill of 2009 in order to be eligible for State water grants or loans. These changes are discussed further in Part II, Section B: Changes in UWMP Requirements Since 2005.

Purpose of the UWMP

The purpose of this report is to review the overall supply and demand of water for the City of El Centro, identify any possible deficiencies in the water supply for the next 20 years (2010-2030). There is no foreseeable water shortage in the City of El Centro for the next 25 years. The City of El Centro uses Colorado River water that can supply the City with sufficient water to meet all projected demand. Thus the City is not affected by climatic related supply shortages. There was a 10-year drought on the Colorado River

(Oct 1999 - 2010); however, storage on the river was sufficient and the crucial elevation of 1075 was not reached. In addition, Imperial Irrigation District (IID) has senior water rights to Colorado River water and ranks urban supply higher than the agricultural supply; so even were drought on the Colorado River to impact IID's supply, the City's use would not be impacted.

An awareness of the importance of a sound water policy is important in recognizing that water in California is becoming a stretched resource. In fact, California's use of 5.2 MAFY of Colorado River water exceeds its right to 4.4 MAFY. This led to the Quantification Settlement Agreement of 2010 (QSA), under which the amount of Colorado River water available to California and to the Imperial Valley was quantified.

Land use decisions based in part upon water resources have significant effects on the physical, social, and economic character of the county. Although the UWMP is concerned with long-range goals and objectives, attention should also be given to currently existing conditions and issues. This approach will enable the City to face important issues today, thereby avoiding problems in the future.

In addition to the statement of goals, objectives and policies, the UWMP includes discussions, data, and water conservation programs which provide for the prudent and conscientious management and utilization of water resources for future development in the City. The implementation of the UWMP is meant to assure that water resources are conserved and utilized as efficiently as possible, and to provide for the long-term viability and availability of this precious resource.

This UWMP follows the outline order of the *Guidebook to Assist Urban Water Suppliers to Prepare a 2010 Urban Water Management Plan* (Final, March 2011), and includes the following:

- Section 1 - Plan Preparation
- Section 2 - System Descriptions
- Section 3 - System Demands
- Section 4 - System Supplies
- Section 5 - Water Shortage Contingency Plans
- Section 6 - Demand Management Measures

*** Following Paragraphs in italicized text are verbiage from the law.

Section 1 - Plan Preparation

Coordination

Each urban water supplier shall coordinate the preparation of its plan with other appropriate agencies in the area, including other water suppliers that share a common source, water management agencies, and relevant public agencies, to the extent practicable (10620(d)(2)).

Table 1 - Coordination with appropriate agencies							
Coordinating Agencies ^{1,2}	Participated in developing the plan	Commented on the draft	Attended public meetings	Was contacted for assistance	Was sent a copy of the draft plan	Was sent a notice of intention to adopt	Not involved / No info

County of Imperial Planning and Development			X	X	X	X	
City of Calexico			X	X	X	X	
City of Brawley			X	X	X	X	
City of El Centro	X	X	X	X	X	X	
City of Imperial			X	X	X	X	
General public			X		X	X	
Salton Sea Authority					X	X	

Figure 4 - TABLE 1 - Coordination with appropriate agencies

Development of this plan was coordinated with the Imperial Irrigation District, City Staff, the Mayor's Office, City Planning, Fire, Building, Police, and local Emergency Services offices.

Drafts of the Management Plan were distributed to Imperial Irrigation District, Imperial County Planning/Building and Public Works Departments, and the City of El Centro for review and revisions. The final draft was distributed in May 2011 to staff of the Imperial Irrigation District; the cities of Brawley, Calexico, Imperial; and Imperial County for agency comments and recommendations. Comments and recommendations have been incorporated into the Management Plan. Copies were distributed to Imperial County

City of El Centro 2010 Urban Water Management Plan

Planning/Building and Public Works departments; Imperial Irrigation District Public Affairs; cities of Brawley, Calexico, Imperial; the public libraries of El Centro, Calexico, Brawley, and Imperial; and to others on request for public review.

Every urban water supplier required to prepare a plan pursuant to this part shall, at least 60 days prior to the public hearing on the plan required by Section 10642, notify any city or county within which the supplier provides water supplies that the urban water supplier will be reviewing the plan and considering amendments or changes to the plan. The urban water supplier may consult with, and obtain comments from, any city or county that receives notice pursuant to this subdivision (10621(b)).

The City provides water to connections within its service boundary only. However, the city sent notifications to all the cities and other agencies listed in Table 1 at least 60 days prior to the UWMP public hearing that the plan was being reviewed and changes were being considered.

The urban water supplier shall provide that portion of its urban water management plan prepared pursuant to this article to any city or county within which it provides water supplies no later than 60 days after the submission of its urban water management plan (10635(b)).

The City provides treated water supplies to the County of Imperial for its offices and operations. A copy of the 2010 UWMP will be provided to each city in the Imperial Valley that is required to submit an UWMP, the County of Imperial, and the Imperial Irrigation District no later than 60 days after submission to DWR.

Each urban water supplier shall encourage the active involvement of diverse social, cultural, and economic elements of the population within the service area prior to and during the preparation of the plan (10642).

Prior to adopting a plan, the urban water supplier shall make the plan available for public inspection and shall hold a public hearing thereon. Prior to the hearing, notice of the time and place of hearing shall be published within the jurisdiction of the publicly owned water supplier pursuant to Section 6066 of the Government Code. The urban water supplier shall provide notice of the time and place of hearing to any city or county within which the supplier provides water supplies. A privately owned water supplier shall provide an equivalent notice within its service area (10642).

The City of El Centro encourages community participation in its urban water management planning efforts.

Copies of the draft plan were available at City Hall. The City published notice in the local newspaper of the availability of the draft UWMP for public inspection and stating

the date and time of the public hearing to adopt the UWMP. The notice was published once a week for two successive weeks.

The hearing took place on June 21th, 2011 at 6:00 pm at City Hall located at:

1275 Main Street
El Centro, California 92243

Following the public meeting, a formal public hearing was held during the regular meeting of the City Council for review and comment on the draft plan before the City Council's approval.

The final plan, which was adopted by City Council on July 21, 2011, was distributed to the cities of Brawley, Calexico, Calipatria, El Centro, Holtville, Imperial, and Westmorland; Imperial County Planning/Building and Public Works departments; Imperial Irrigation District's Public Affairs; public libraries in the cities of El Centro, Calexico, Brawley, and Imperial; and to others upon request. The final plan was submitted to the California Department of Water Resources within 30 days of Council approval.

Plan Adoption, Submittal and Implementation

The amendments to, or changes in, the plan shall be adopted and filed in the manner set forth in Article 3 (commencing with Section 10640) (10621(c)).

If changes are necessary to the UWMP after adoption by the city, the City will hold another public hearing to readopt the plan.

*After the hearing, the plan shall be adopted as prepared or as modified after the hearing (10642).
An urban water supplier shall implement its plan adopted pursuant to this chapter in accordance with the schedule set forth in its plan (10643).*

An urban water supplier shall implement its plan adopted pursuant to this chapter in accordance with the schedule set forth in its plan (10643).

The city will implement the UWMP after adoption. Procedures to implement will include annual reviews of progress on the Demand Management Measures, use of the UWMP in developing a revised Water Master Plan and in the planning process of new development within the City.

City of El Centro 2010 Urban Water Management Plan

An urban water supplier shall submit to the department, the California State Library, and any city or county within which the supplier provides water supplies a copy of its plan no later than 30 days after adoption. Copies of amendments or changes to the plans shall be submitted to the department, the California State Library, and any city or county within which the supplier provides water supplies within 30 days after adoption (10644(a)).

Within 30 days of adoption, the adopted UWMP will be submitted to DWR and the California State Library. El Centro does not supply water to another city or nor to any area of Imperial County.

Not later than 30 days after filing a copy of its plan with the department, the urban water supplier and the department shall make the plan available for public review during normal business hours. (10645).

Within 30 days of submitting the UWMP to DWR, the adopted UWMP has been or will be available for public review during normal business hours. The plan is available for review at City Hall located at:

1275 Main Street
El Centro, CA 92243

Section 2 - System Description

Describe the service area of the supplier (10631(a)).

Service Area Physical Description

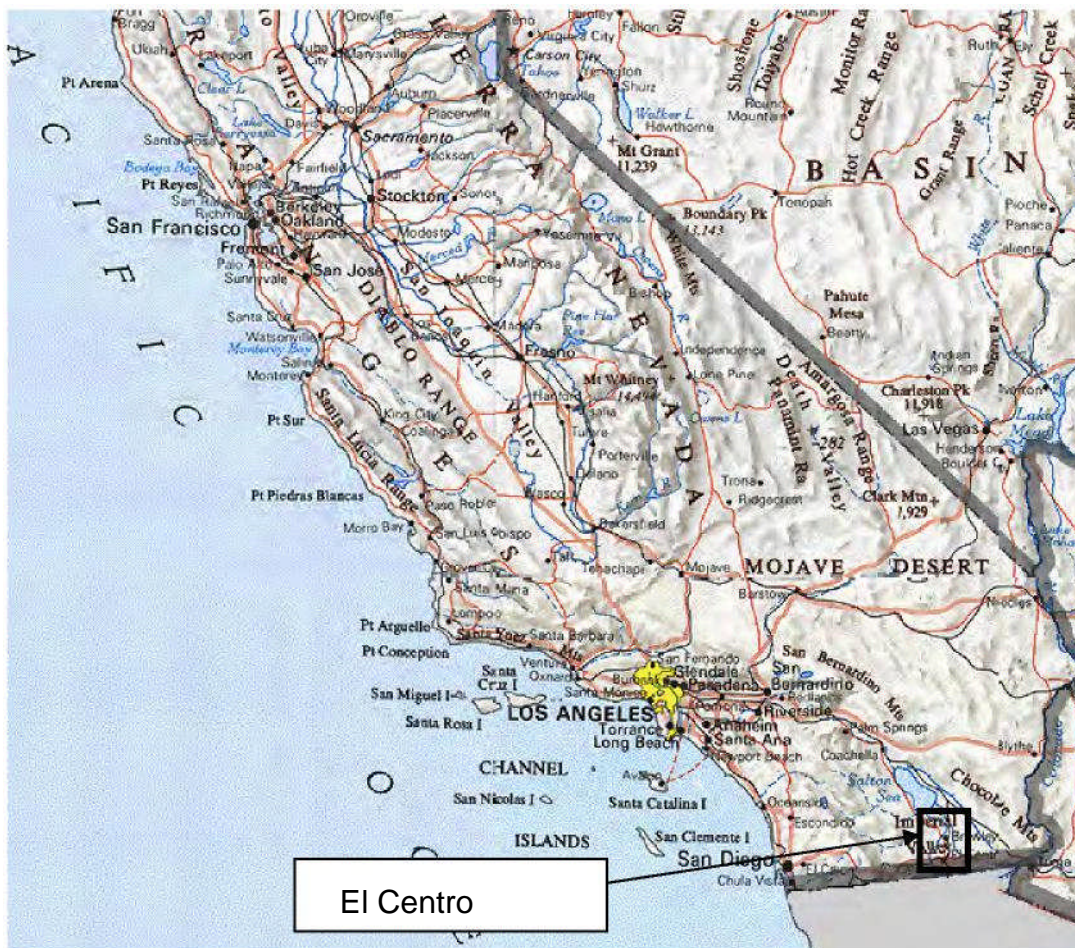

Figure 5 - Vicinity Map for the City

The City of El Centro is located in the County of Imperial, approximately 120 miles east of San Diego, at the intersection of Interstate 8 and Highway 86. The City covers an area of 11.019 square miles. The Imperial County seat is located in the City of El Centro. El Centro, with a population as of 2010 of 45,365, is the largest city in the county and is the principal trading center of the county. Several federal and state government offices are located in El Centro, including the U. S. Bureau of Land Management, Federal Bureau of Investigation, U.S. Border Patrol Headquarters, Social Security Administration, U.S. Department of Agriculture, and the California Employment

Development Department.

The City of El Centro Urban Area is approximately 12,800 acres and surrounds the incorporated City of El Centro. The El Centro Urban Area is generally bounded on the west by Austin Road; on the north by the Central Drain, Dogwood Road, and Villa Road; on the east by State Highway 111; and on the south by Northrop Road (extension), McCabe Road, a line approximately 1,320 feet east of Dogwood Road, and Chick Road.

The City of El Centro is located in Imperial County, which is located in the southeast corner of California. It is bordered on the west by San Diego County, on the north by Riverside County, on the east by the Colorado River which is the California/Arizona boundary, and on the south by 84 miles of the International Boundary with the Republic of Mexico. Imperial County encompasses an area of 4,597 square miles or 2,942,080 acres. The Imperial Valley is an area within Imperial County that extends southward for 50 miles from the southern end of the Salton Sea to Mexico.

The Imperial Valley was created when the Colorado River formed a delta that isolated the Salton Trough from the Gulf of California. Subsequently, under desert conditions, the inland sea dried up. Later, the trough was occupied by lakes for various periods, and deposition into these lakes gave the valley its characteristic flat lands and fertile soils.

The geographic center of the Imperial Valley is one of the most productive agricultural areas in the world, despite the fact that it is in a very arid region. The general area of the Imperial Valley, also known as the Imperial Unit, is bounded on the north by the Salton Sea, on the south by the U.S./ Mexico border, on the east generally by the East Highline Canal, and on the west generally by the Westside Main Canal (See Figure 6).

Approximately fifty percent of lands in Imperial Valley are undeveloped and are under federal ownership and jurisdiction. One-fifth of the nearly 3 million acres in Imperial Valley are irrigated for agricultural purposes, most notably the areas known as Coachella Valley and the Imperial Valley. The Net irrigated agriculture area in 2010 consisted of 474,140 acres (IID 2010 Area Receiving Water Report). The developed area within the Imperial Valley represents less than one percent of the total amount of land. Approximately seven percent of Imperial Valley is within the boundaries of the Salton Sea.

A significant geographical feature in the Imperial Valley is the Salton Trough, which contains the Salton Sea and the Imperial Valley, and has been evolving for millions of years. It is a rift in the earth's crustal plates. The East Pacific Rise is the boundary between the Pacific and North American Plates. It extends up the Gulf of California by a series of spreading centers with strike slip faults. The thinning of the crust from the slow but continuous widening of the Salton Trough causes the earth's magma to rise closer to the surface and generates abnormally high heat flow, which in turn heats deep ground waters.

The trough is a structural extension of the Gulf of California. In prehistoric times it contained the ancient Lake Cahuilla (not to be confused with the present Lake Cahuilla which is located at the terminus of the Coachella Branch of the All-American Canal).

City of El Centro Water

The City of El Centro receives raw water from the Imperial Irrigation District. Approximately three percent of the Imperial Irrigation District's untreated water is ultimately used for urban purposes and is provided indirectly to consumers through a variety of public and private treatment agencies.

The City of El Centro's sphere of influence is located within the Imperial Unit of the Imperial Irrigation District's Irrigation (IID) service area. The 699,092 acre Imperial Unit serves the Imperial Valley including the urban areas for the cities of El Centro, Calexico, Imperial and Brawley and approximately a quarter of Imperial County's unincorporated area. In total, IID delivers water to an area of just over 520,000 acres, including cities, cemeteries, schools, parks, golf courses, etc. in addition to the irrigated land. The Imperial Irrigation District's total service area, lying entirely within Imperial Valley, is divided into four units: Imperial, West Mesa, East Mesa, and Pilot Knob, with a gross acreage of 1,061,637 acres.

A significant portion (around 97%) of the water demand in the Imperial Region is for irrigation. Agriculture is successful in this region for two reasons: 1) rich soils which have accumulated on the valley floor over thousands of years; and 2) the large quantity of water that is transported 80 miles from the Colorado River via the All-American Canal and distributed to farmlands by a complex system of smaller canals.

Recycled water low in salinity could be used for agricultural; however, treatment and distribution of recycled wastewater low in salinity is not cost effective option at this time. Colorado River water salinity has averaged 760 parts per million over the last 20 years, and treated municipal wastewater is approximately 200-300 ppm higher in salinity. In addition, agricultural producers are averse to using treated wastewater due to consumer perceptions that the crops might be tainted.

An expanded water conservation program is one of several priorities supported by the City, and conservation programs such as school education, public information, and landscape design and water use standards are being implemented.

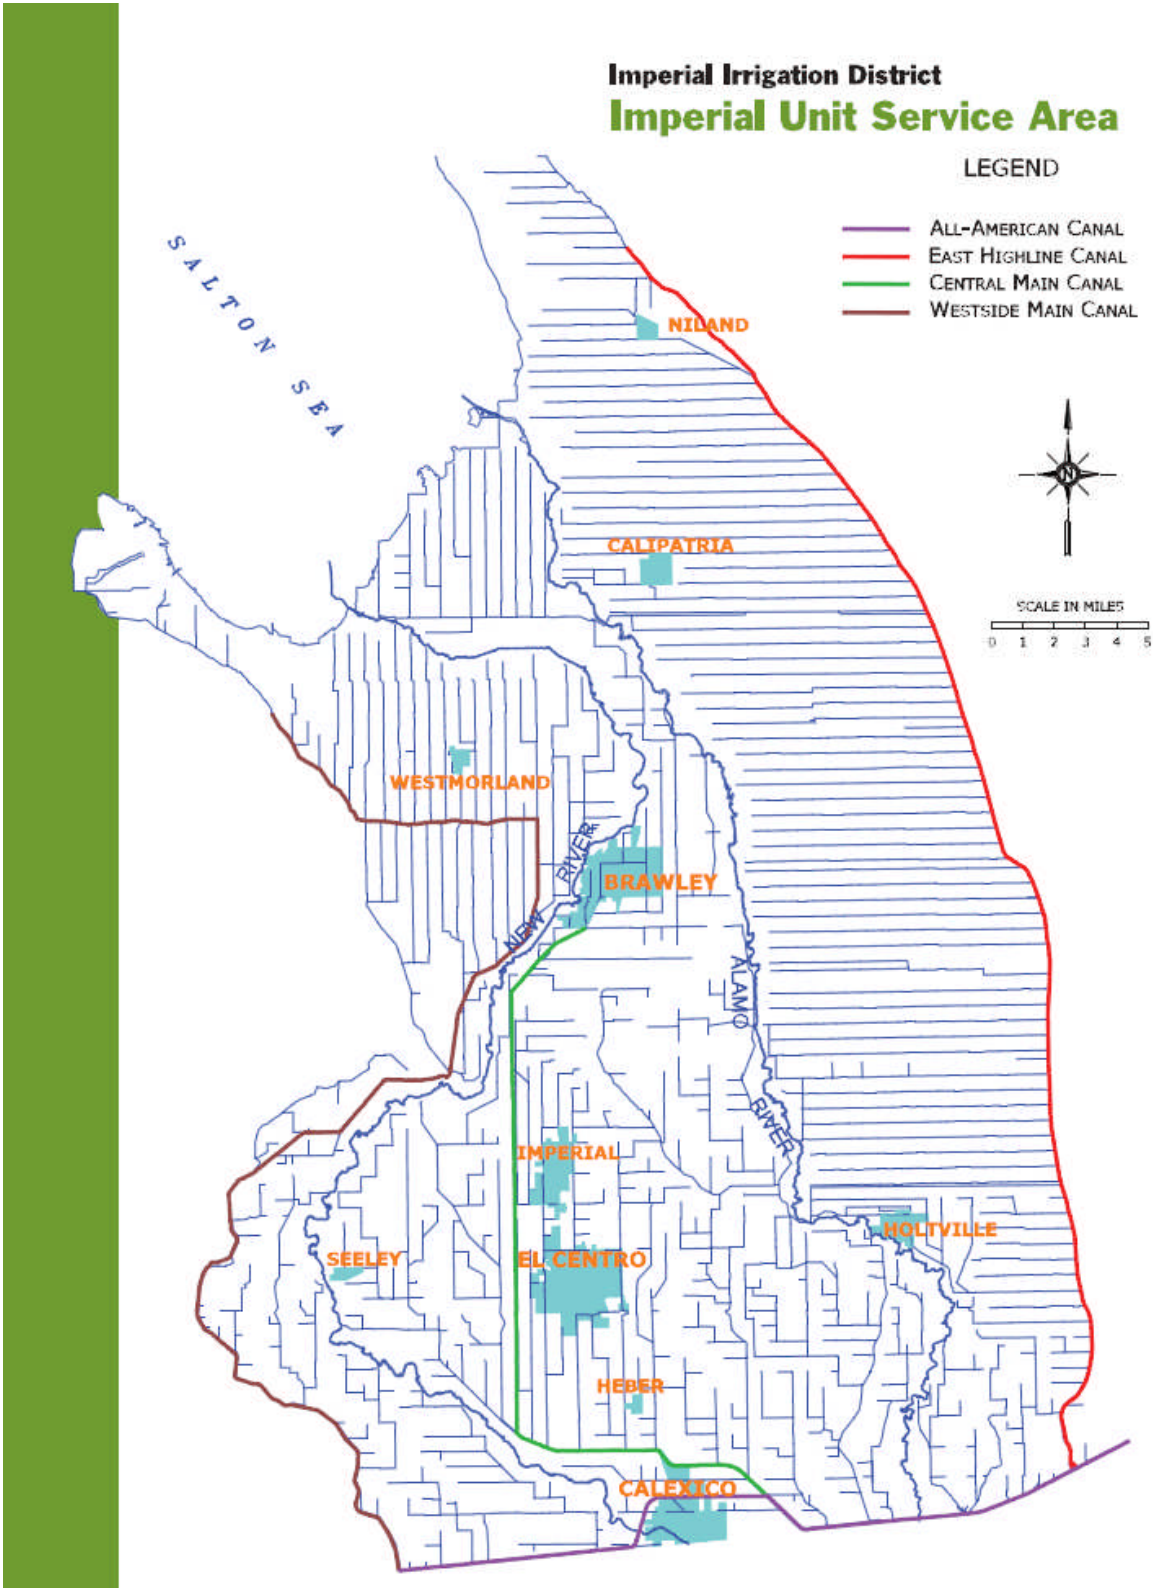

Figure 6 – IID Imperial Unit Service Area

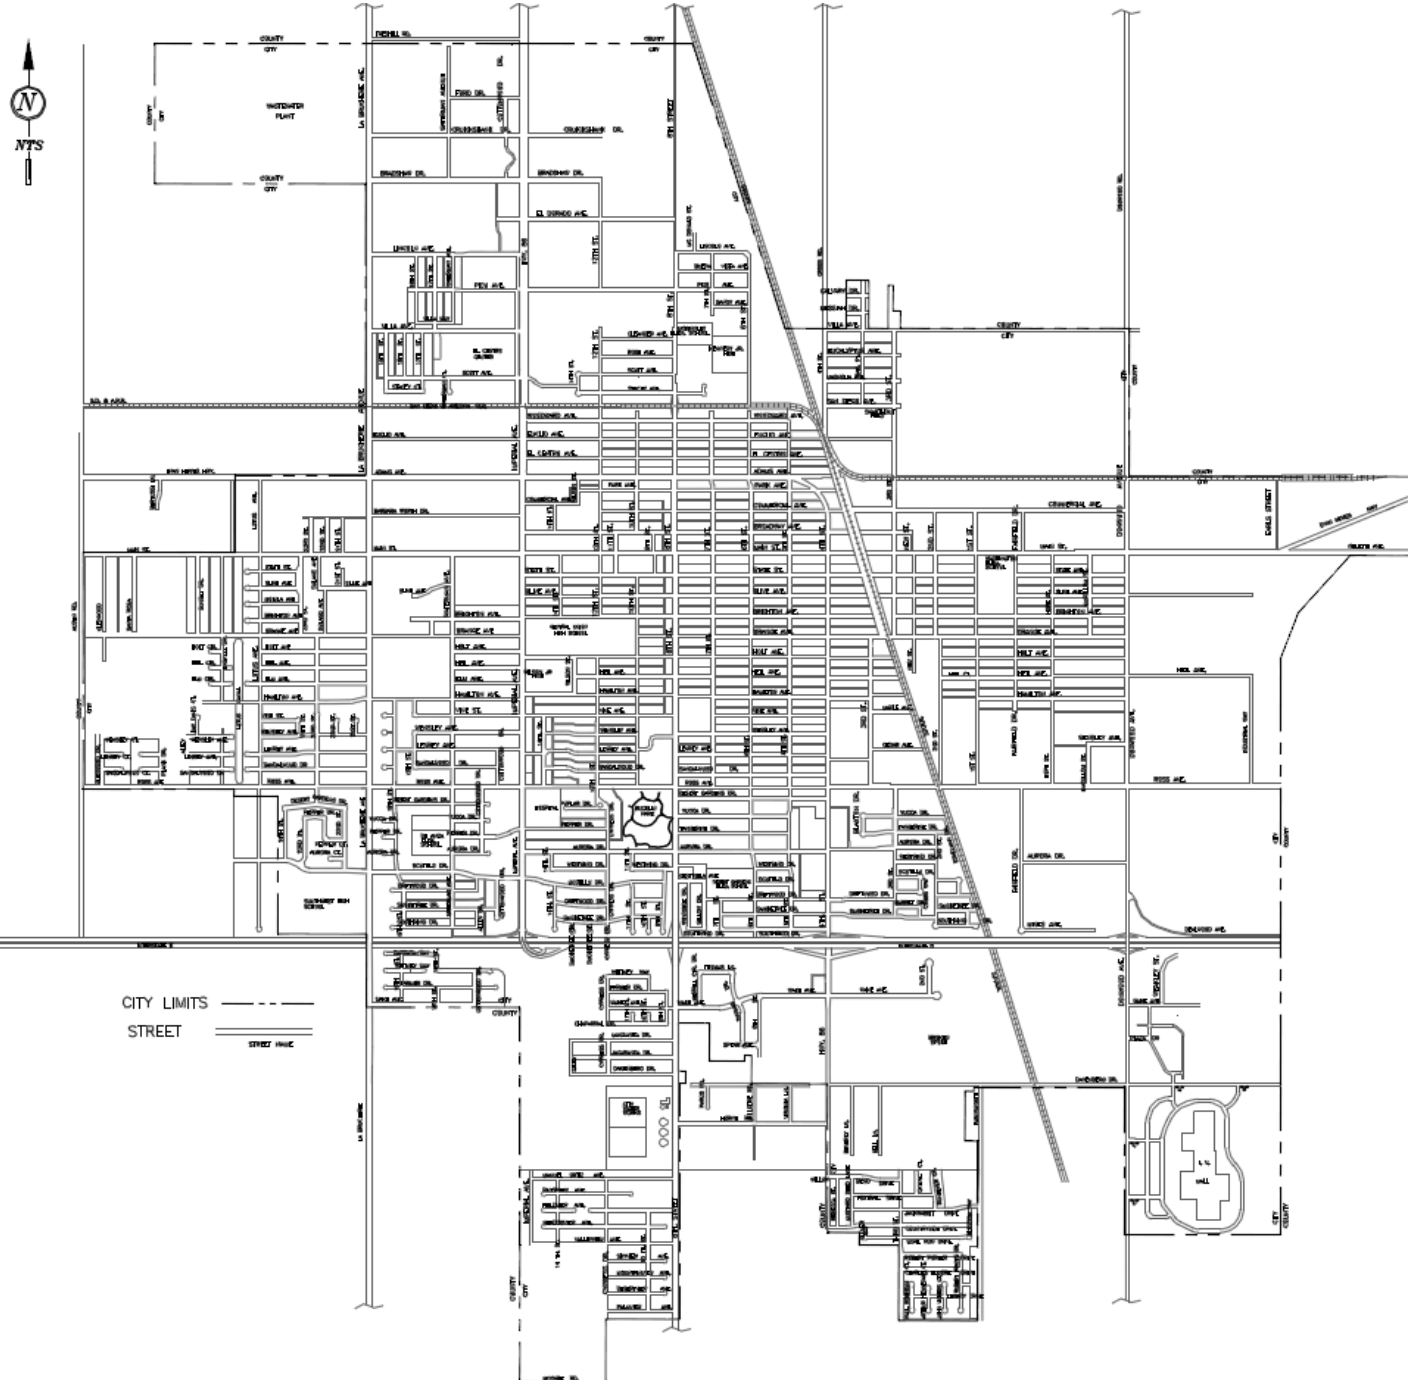

Figure 7- City Limits of the City of El Centro

City of El Centro Background

Over the past fifty years, the City of El Centro has developed as a major government and commercial center for the Imperial Valley in southern California. Although surrounding agricultural activities remain a major part of the City's economy, the government and wholesale/retail trade within the city have promoted its growth. During the past twenty years, separate water and wastewater master plans were prepared that evaluated the capabilities of facilities to meet service requirements.

An updated single master plan report was prepared in 2006 to evaluate the current conditions of water and wastewater infrastructures and make recommendations on facility improvements. This document was used in the preparation of this report.

The City provides potable water to homes and businesses by treating raw Colorado River water imported into the Imperial Valley and delivered to the city by the Imperial Irrigation District (IID). The imported water is a surface water source. Its treatment must comply with the Surface Water Rule of the Federal and State Safe Drinking Water Act. The California Department of Public Health (CDPH) granted a permit to the City of El Centro to supply water for domestic purposes to the City of El Centro. The treatment facility currently meets all applicable United States Environmental Protection Agency domestic water quality standards.

Description of City Facilities

City of El Centro Distribution System

An extensive pipeline network supplies water to the City's customers at a normal operating pressure of 60 psi. Much of the distribution network is relatively new because of the population increase and the corresponding housing developments occurred in the last decade. Also, the location of the water treatment plant changed in the mid-1950's creating new location requirements for the principal water lines.

A 30-inch pipe transports water from the treatment facility along Dannenberg Road. If the pipe were to be out of service, the only source of treated water would be the

remote 5.0 MG storage tank on La Brucherie Road. Assuming the maximum velocity of 10 fps, the capacity of the 30-inch pipeline from the treatment plant can transport is 22,000 gpm (31.7 mgd), or 35,755 acre-feet per year.

Two water transmission pipelines extend from the 30-inch pipe in front of the water treatment plant. These pipelines carry water to the entire city. One 18-inch pipeline runs west from the treatment plant and then north along Imperial Avenue. At Hamilton Avenue, it continues west for one half mile until La Brucherie Road. There, it turns north and continues for several miles with several 12-inch lines branching from it.

The pipeline that heads north from the treatment facility is 30 inches in diameter. It flows north from the treatment plant along 8th Street until it reaches Driftwood Drive. There, it splits into one 18-inch diameter main and one 24-inch diameter main. The 18-inch main flows east along Driftwood Road and provides service to the eastern and northeastern portions of the city. The 24-inch main flows north to Hamilton Avenue and provides water to the north part of the city.

Water Treatment Plant Distribution Pump Station

Two booster pumping stations pressurize the water distribution system to the 60 psi operating pressure. One is located at the water treatment plant and the other is at the storage facility on La Brucherie Road. Three pumps at the treatment facility increase the pressure of the water to the normal distribution pressure. A fourth pump is original to the facility and is rated to pump at 40 psi. The three pumps were installed in 1993 when the system operating pressure was increased from 40 to 60-psi. Each is a 200 horsepower (hp) variable speed pump that has a capacity of 4,000 gpm at a 60 psi. The fourth, antiquated, pump is a constant speed centrifugal pump that can pump 4,500 gpm at 40 psi. At 60 psi, its efficiency and capacity are extremely reduced. As a result, it is used solely as a backup in the event that extra capacity becomes necessary or if the system's pressure is reduced significantly. Currently, the plant has a pumping capacity of 12,000 gpm with all three 200-hp pumps operating at full capacity. When a fourth 200-hp pump is installed, the treatment plant's pumping capacity will increase to 16,000 gpm.

La Brucherie Distribution Pump Station

At the La Brucherie facility, two pumps that are identical to those at the treatment plant pressurize the water to the system's normal operating pressure. There, two 200-hp variable speed pumps can each pump 3,500 gpm at 60-psi. The total pumping capacity of the La Brucherie facility is 7,000 gpm.

Water exits the La Brucherie pumps to the distribution system through an 18-inch cement mortar lined (CML) steel pipe. Water enters the storage tanks through the same 18-inch steel pipe. Water entering and exiting the facility is metered through a 12-inch meter. This produces a significant loss in pressure while water is entering the distribution system and it places higher demand on the station's pumps. For the same quantity of water to flow through the 12-inch meter as through the 18-inch pipe, the water's velocity must be much greater. The water experiences significant head loss from flowing through a different sized pipe and from frictional losses that increase substantially with the higher velocity. As a result, the pressure of the water after flowing through the meter is roughly 10 psi less than when it exits the pumps (at maximum flow).

Therefore, the exiting pressure of the pumps at the La Brucherie station must be set higher than the normal 60-psi operating pressure. This places more electrical demand on the pumps that could be reduced if the current meter were replaced with an 18-inch meter.

The water facilities include infrastructure for treatment, storage, and distribution. The water treatment plant consists of two raw water reservoirs, two clarifiers, a filtration system, and chlorination. The distribution system consists of a network of pipelines and two pumping facilities. Four treated water storage tanks supply water to the distribution system. Three tanks are located at the treatment facility and the fourth is located at La Brucherie Road and Barbara Worth Avenue.

El Centro is in an active earthquake region. There is concern that a major earthquake or other emergency could interrupt the IID raw water supply. This would require the City to rely on treating raw water from its storage reservoirs. The City's available raw water storage may be less than the volume necessary for seven days of peak summer water demand.

The City of El Centro completed a water plant expansion in 2009.. The lack of redundancy in treatment components was addressed. Redundant components allow emergency repairs or unanticipated maintenance on other similar treatment units without reducing production capacity. Filtration is considered the most vital treatment process in meeting present and anticipated new requirements.

City of El Centro Water Storage Facilities

Water from the South Date Canal flows west via a 42-inch concrete pipe to the raw water pumping structure adjacent to the raw water reservoirs. Water received from the Dahlia Lateral enters the treatment site from the north end of the property in 18-inch and 24-inch concrete pipes that carry the water to the same pumping structure. As was mentioned earlier, the total amount of raw water that can currently be supplied to the City through the canals and delivery pipes is 31.6 MGD (35,755 acre-feet per year).

The City of El Centro has both raw and treated water storage facilities in case of emergencies. Treated water storage is for unanticipated interruptions in the water treatment plant capacity. Raw water storage is for unanticipated interruptions in raw water supply.

Raw water from South Date Canal delivery gate 20B and Dahlia Lateral delivery gate 1 is stored in the four reservoirs located on the treatment facility premises.

The four new raw water reservoirs, which replaced the existing two reservoirs, are located on the western side of the plant site that were constructed as a part of the new water treatment plant that was placed into operation in 2009. All ponds have a depth of 14 feet. Each reservoir has a nominal storage capacity of 12.5 million gallons (MG) for an approximate total of 50 MG of untreated water. The concrete slopes that form the sides of the reservoirs have side slopes of 2- horizontal to 1- vertical (2:1).

Water is pumped into the settling pond #1, flows by gravity to the settling pond #2, and then continues by gravity flow to ponds #3 and #4. Water can only be pumped to settling pond #1 or #2 from the raw water pump structure.

A 36-inch concrete pipe leads from the structure to the north reservoir and a 48-inch concrete pipe extends to the south reservoir. A 48-inch concrete pipe connects the two ponds. From the reservoir, the water enters the treatment system through distribution chamber via two concrete pipes, one from each reservoir. A 48-inch pipeline and 36-inch pipeline lead from the north and south reservoirs, respectively. This configuration utilizes the largest pipes and has adequate retention time for sedimentation of silt carried in the raw water. See Figure 8.

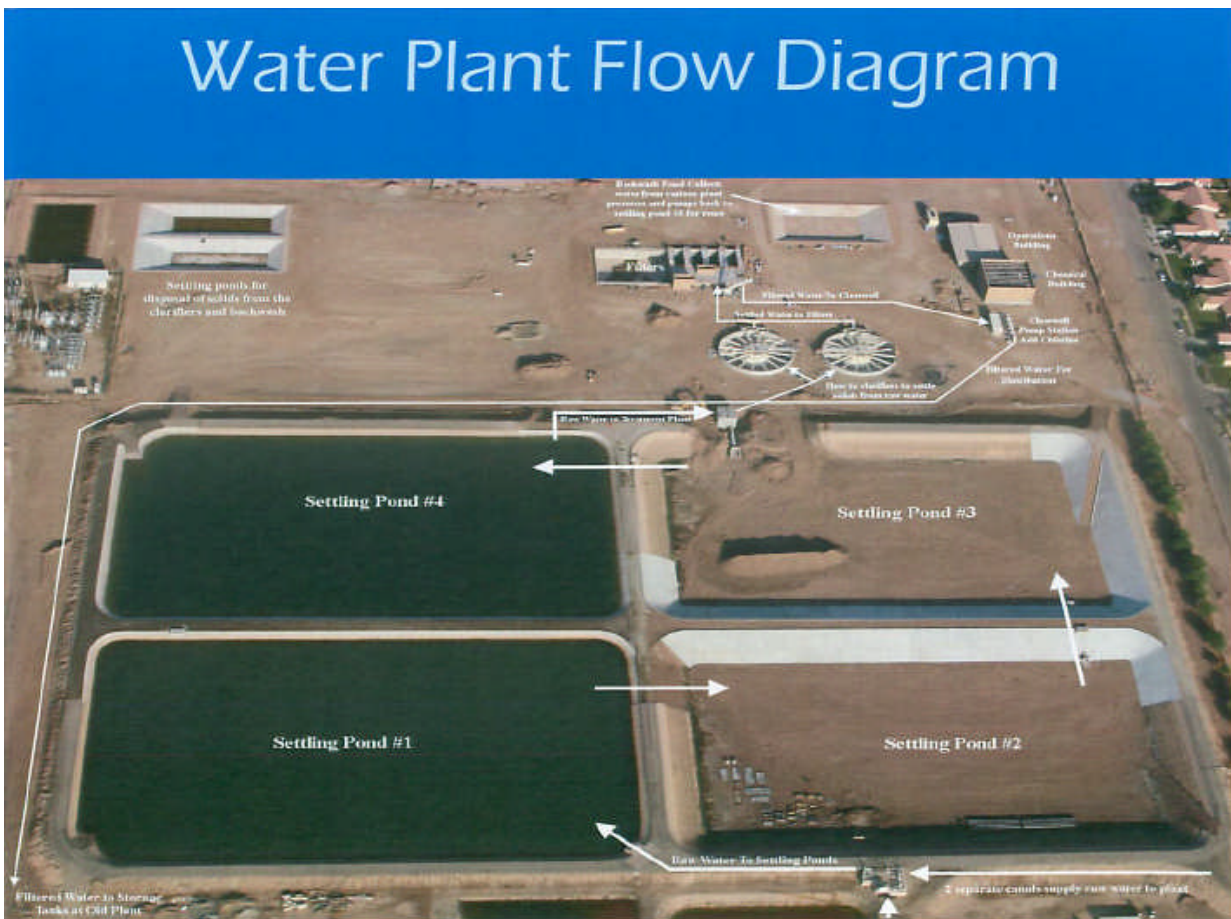

Figure 8 - Water Plant Flow Diagram

An overflow pipe is located on the north wall of the north reservoir. It drains to an irrigation ditch north of the plant. The south pond overflows into the north pond, above the 48-inch circulation pipe. The overflow outlets prevent overtopping of the reservoirs where erosion of the reservoir embankments could undermine the structural integrity of the side slopes and cause massive spilling. Shutting down the inflow pump station could also prevent a major overflow.

After undergoing treatment, the water is stored in four treated water tanks. Three tanks are located at the treatment facility and another is at the corner of La Brucherie Road and Barbara Worth Avenue. The total treated water storage is 15.0 MG. At the treatment facility, two tanks were installed with the original construction of the facility in 1956 and have a capacity of 2.5 MG each. In 1977, an additional treated water storage tank was placed on the site with a capacity of 5.0 MG, thereby doubling the amount of storage to 10.0 MG. The latest water storage capacity addition was the 1993 installation of a 5.0 MG tank at the corner of La Brucherie Road and Barbara Worth Avenue, located approximately 2 miles northwest of the treatment facility. In total, 67.5million gallons of raw and treated water can be stored if all the reservoirs and tanks were full simultaneously (see Table 5 below).

Type of Storage	Location	Type of Reservoir	Capacity (MG)	Year Constructed
Raw Water Storage				
Ponds #1, #2, #3, #4	Treatment Plant	Raw Water Settling Ponds	50.0	2009
Total Raw Water Storage			50.0	
Treated Water Storage				
Reservoir Tank #1	Treatment Plant	Welded Steel Tank	2.5	1956
Reservoir Tank #2	Treatment Plant	Welded Steel Tank	2.5	1956
Reservoir Tank #3	Treatment Plant	Welded Steel Tank	5.0	1977
Remote Reservoir	La Brucherie at Barbara Worth	Welded Steel Tank	5.0	1993
Total Treated Water Storage			15.0	
Total Water Storage			67.5	

Figure 9 - Total Water Storage Capacity

The two 2.5 MG tanks receive treated water directly from the filter Clearwell pump station, with water entering the tanks approximately six feet above the bottom. The 30-inch pipe splits at a “T” between the two tanks into two 24-inch concrete pipes leading directly into the tanks.

Parameter	MGD	GPM
Annual Daily Average	7.17	
Maximum Day	10.51	
Minimum Day	3.77	
Maximum Day Peak Hour		11,319
Minimum Day Peak Hour		4,722
Maximum Month Average Daily	9.31	
Minimum Month Average Daily	5.01	

Figure 10 - 2010 Distribution System Flows

The 5.0 MG storage tank located at the facility, which was constructed in 1977, similarly receives treated water from the filter Clearwell pumps via an asbestos cement pipe (ACP). The roof of the tank is 24 feet above the ground. The tank has a diameter of 197' 6". Flow to the tank passes through a 30-inch butterfly valve. Water enters the tank three feet above the bottom in the northeast section of the tank through a 36-inch diameter inlet. The outlet is located 78 feet from the inlet and 3' 5" above the bottom. The outlet is located on the north side of the tank. Water exits the tank through a 30-inch outlet and flows to the booster pumps through a 30-inch ACP and 24-inch butterfly valve.

At the main pumping room, the water is pressurized to the distribution system's normal operating pressure of 60 psi. Overflow from the 2.5 MG reservoirs is discharged through an 18-inch concrete pipe that leads west to the backwash pond. Like the others, this tank also overflows to the backwash pond. Overflows exit the tank on the northwest side through a 24-inch reinforced concrete pipe (RCP) and flows by gravity to the southeast corner of the backwash pond.

Water in the 5.0 MG La Brucherie storage tank is pumped from the tank into the distribution system to meet peak water demands during mornings and evenings. During the three-hour periods, 2,500 gpm is pumped into the system. The morning and afternoon releases generally start at 7 a.m. and 5:30 p.m., respectively. The tank is replenished during minimal consumption times, usually in the early afternoon and early morning. For this to happen, three criteria must be met. First, the pumps must not be pumping into the distribution system. Second, the water level in the tank must be less than 38 feet above the ground (40 foot tank). And finally, the system pressure must be greater than 55.4 psi.

Water from the La Brucherie storage tank can also be released outside of its normal schedule. Water is pumped into the distribution system when the system pressure falls below 54 psi for more than 180 consecutive seconds. The secondary pump begins pumping when the system pressure falls below 53-psi. This remote facility allows the system to meet varying water demands with more consistent water pressure throughout the city than would be the case were water pumped only at the treatment plant. It also allows better utilization of existing infrastructure capacity.

Land Use

The Imperial Valley is predominantly an agricultural area. Agricultural development in the Imperial Valley began at the turn of the twentieth century and now includes approximately 475,000 acres of irrigated land that support a \$1 billion-plus annual local agricultural economy. Imperial Irrigation District is the regional water supplier in the Imperial Valley, delivering Colorado River flows to all agricultural lands and urban water retailers within its water service area. Imperial Irrigation District operates open channel gravity flow irrigation and drainage systems and continually strives to develop innovative ways to improve its operations, increase reliability, and to conserve water.

While the agriculture-based economy is well-established, land use is expected to vary somewhat over the coming years as urbanization and growth occur adjacent to existing urban areas. In addition, development of renewable and geothermal energy in the rural areas is expected.

Current Land Use

Due to contractual restrictions related to IID's Colorado River entitlement, total farmable acres remain fairly constant and total net acres cropped exhibit minor fluctuations. Over the past five years (2005-2009), cropping patterns have remained relatively constant with variations in forage crop acreage occurring as a result of market price fluctuations, production cost factors, and insect/disease pressures.

	2005	2006	2007	2008	2009
Total Forage	249,620	266,077	246,635	217,855	192,632
TOTAL GARDEN CROPS	94,751	101,096	98,992	100,354	94,679
TOTAL FIELD CROPS	366,963	371,734	374,423	415,208	380,913
TOTAL PERMANENT CROPS	18,821	19,100	19,196	19,753	19,758

More than 120 types of crops are currently grown. In addition, a number of feedlots and dairies located in the Valley have significant economic impact. In 2009, based on acreage, Imperial Valley's top twelve crops were alfalfa, wheat, Bermuda grass, Sudan grass, lettuce, sugar beets, carrots, kleingrass, broccoli, onions, melons and sweet corn, representing nearly 90% of the cropped acreage. In the Imperial Valley, the total area farmed was 488,499 acres in 1990, 481,151 acres in 1995, 479,000 acres in 2000 and 473,903 acres in 2009.

Urban land uses within IID's Imperial Unit consist of cities, state prisons, a military base, geothermal plants, and other smaller industrial users. Most of the urban lands are concentrated in and around the incorporated and unincorporated cities with some small clusters of rural residences located away from the population centers.

IMPERIAL COUNTY Land Use Distribution (in Acres), 1985

Figure 11 - Imperial County Land Use Distribution

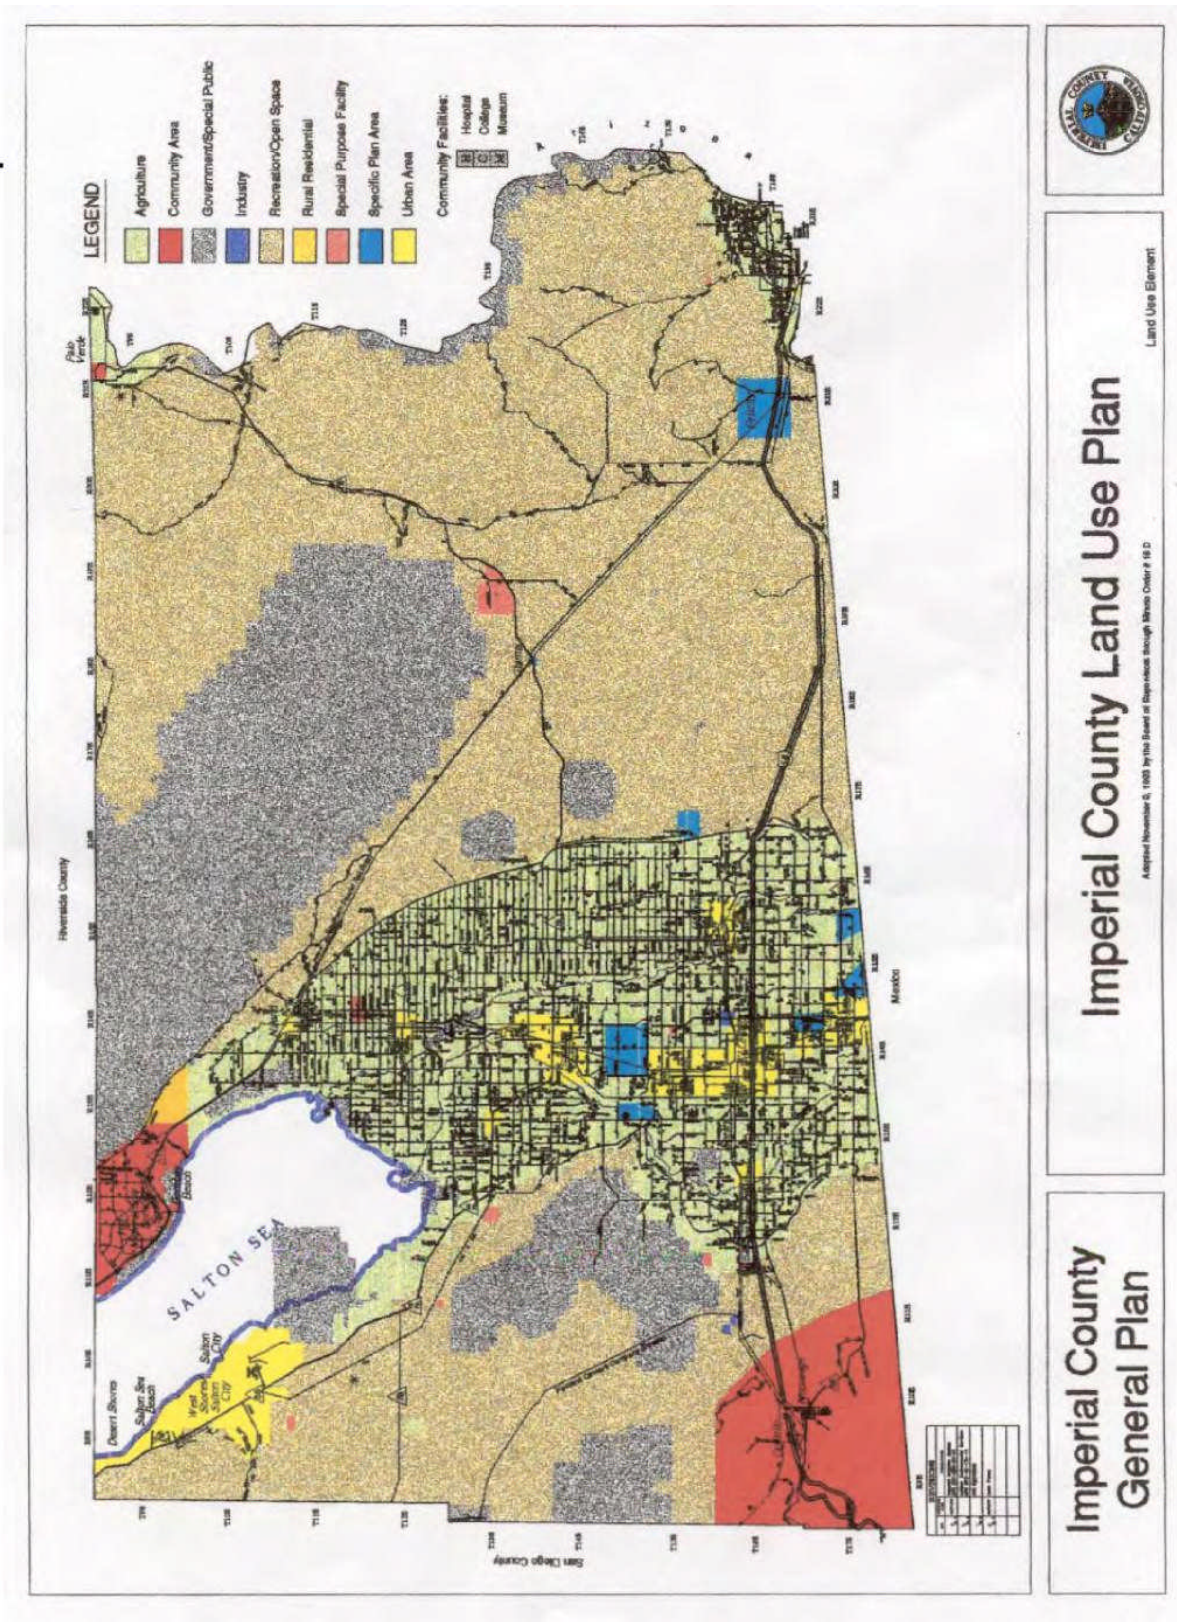

Figure 12 - Imperial County Land Use Map

Future Land Use

The Imperial County General Plan, updated September 2004, identifies urban areas surrounding the incorporated cities of Brawley with 9,890 acres, Calexico with 6,980 acres, Calipatria with 2,880 acres, El Centro with 16,000 (City of El Centro Draft General Plan, June 2003) acres, Holtville with 4,080 acres, Imperial with 8,480 acres, and Westmorland with 880 acres. Urban areas surrounding the unincorporated communities include Heber with 960 acres, Niland with 1,290 acres and Seeley with 1,520 acres. Urban areas for specific plans located within Imperial Unit boundaries include: East Border Crossing Specific Plan area with 1,700 acres, Holtville Air Strip Specific Plan area with 1,830 acres, Mesquite Lake Specific Plan area with 5,760 acres (9 sq miles), and Heber Specific Plan area with 4,770 acres. Some of these designated urban areas have been developed and some have not. Some of these areas could possibly complete developments in the future.

The total urban area surrounding cities and communities located within the Imperial Unit is 52,960 acres or 7.6 percent of the Imperial Unit area. The majority of these lands are currently farmed. Four Specific Plan Areas within the Imperial Unit are designated for possible development. The total area within the four Specific Plan Areas is 14,060 acres or 2.0 percent of the Imperial Unit area. Thus, total combined (actual plus projected) urban area surrounding cities and communities and for the four Specific Plan Areas is 67,020 acres or 9.6 percent of the Imperial Unit area.

Any urban areas yet to be developed will be characterized by a full level of urban services, in particular public water and sewer systems, and will contain or propose a broad range of residential, commercial, and industrial uses. It is anticipated that most urban developments that are yet to be developed will eventually be annexed or incorporated into existing cities, and provide the full range of public infrastructure normally associated with municipalities such as public sewer and water, drainage improvements, street lights, fire hydrants, and fully improved paved streets with curbs and sidewalks that are consistent with city standards.

Trends in land use point to an increase in the development of existing urban areas to provide residential capacity for an increased population. With development of existing urban areas, associated increases in service and infrastructure will follow. Even so, total urban land use in the years 2010 through 2030 will remain small in comparison to agriculture land use within the Imperial Unit.

(Describe the service area) climate (10631(a)).

Climate Factors

Imperial Valley is an arid desert, characterized by hot, dry summers and mild winters. Summer temperatures typically exceed 100 degrees Fahrenheit and the winter low temperatures rarely drop below 32 degrees Fahrenheit. The remainder of the year has a relatively mild climate with temperatures averaging in the mid-70s. The average annual air temperature is 72 degrees Fahrenheit and the average frost-free season is about 300 days per year.

Annual rainfall in the Imperial Valley averages less than three inches, with most rainfall associated with brief but intense storms. The majority of the rainfall occurs from December through March. Periodic summer thunderstorms are common in the region.

El Centro Climate Data 3/1932 – 12/2010													
	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Annual

Figure 13 - City Climate Data

Source: <http://www.wrcc.dri.edu/cgi-bin/cliMAIN.pl?ca2713>

Prevailing Winds

Imperial Valley elevations range from a few feet above to 273 feet below mean sea level. The U.S./Mexico border, located at the southern end of Imperial Valley, has an elevation of four feet above mean sea level. The Salton Sea located at the northern end of Imperial Valley, and the water level is 230 feet below MSL (the sea bottom is 273 feet below MSL). The relatively flat topography (235 feet in 35 miles) of the Imperial Valley and surrounding areas, in conjunction with strong night and day temperature differentials, particularly in the summer months, produce moderate

winds and deep thermal circulation systems. The thermal systems facilitate general dispersion of the air.

Wind data from Naval Air Facility El Centro that is used at El Centro Municipal Airport, show that the prevailing winds blow in a western direction. A crosswind occasionally blows in a southeast direction.

(Describe the service area) current and projected population . . . The projected population estimates shall be based upon data from the state, regional, or local service agency population projections within the service area of the urban water supplier . . . (10631(a)). (Population projections) shall be in five-year increments to 20 years or as far as data are available (10631(a)).

Service Area Population

Figure 17 – TABLE 2 Current and Projected Population

Describe . . . other demographic factors affecting the supplier's water management planning (10631(a)).

The U.S. Census Bureau estimated the median household income in California at \$56,134 in 2009, and \$46,816 in the year 2000. In comparison, median household income in Imperial County was \$31,870 in the year 2000, with a per capita income of \$13,239. Imperial County as a whole, and the City of El Centro in particular, are each designated as a disadvantaged community (68% of median household income in 2000); 2010 US Census data were not available when this UWMP was being prepared.

Source: <http://www.census.gov/hhes/www/income/data/statemedian/index.html>

Imperial County has the highest unemployment rate [of any county](#) in the United States.

Area Name	Labor Force	Employment	Unemployment	Unemployment Rate (%)
Imperial County	81,200	60,800	20,400	25.1
City of Brawley	14,000	10,100	3,900	27.6
City of Calexico	16,200	11,700	4,500	28.0
City of Calipatria	1,800	1,300	500	26.7
El Centro	23,600	18,000	5,600	23.8
Heber CDP	1,800	1,100	700	38.7
City of Holtville	3,500	2,700	800	23.4
City of Imperial	5,000	4,200	900	17.4
City of Westmorland	1,500	900	500	35.6

Section 3 – System Demands

Baselines and Targets

An urban retail water supplier shall include in its urban water management plan. . . due in 2010 the baseline daily per capita water use, urban water use target, interim urban water use target, and compliance daily per capita water use, along with the bases for determining those estimates, including references to supporting data (10608.20(e)).

Using Department of Finance and city pumping records, the 2010 average daily per capita consumption is approximately 158 gallons per day (gpd). Per capita water usage is seasonally dependent, largely due to increased landscape irrigation during the hot summer months. Residential winter usage is only 55% of that during summer months. Residences consume more than all other users and have the most fluctuation

in monthly usage. Commercial and governmental customers also reduce water consumption during cooler months. However, industrial consumption increases substantially during winter, although it accounts for less than 2% of total annual usage.

The City's water billing system identifies customer categories, so that accounts can be classified by use class and can identify each customer by sector and usage category. Unmetered flows include park irrigation and system losses. It is planned that unmetered flows will decrease over time. Currently unmetered flows, or system losses, account for approximately 4% of the total flows. This is expected to be reduced to 1% over the next 20 years through the installation of meters for all irrigation, use of AWWA water auditing software (discussed in detail on page 62) and pipeline replacement projects scheduled to be implemented in the next 20 years. Over the period from 2005 to 2010, treated water flows decreased 12.5%. This is probably mostly due to increased water rates within the City. The City is currently completing another rate study to determine if another rate increase is warranted.

Single family residence water usage comprises approximately 60% of the total amount of water that is billed by the City. Multiple family housing units (apartments, duplexes) use a further 14%, bringing the portion consumed by residences to approximately 75% of the total water sales.

Figure 20 shows water demand by month for 2010. During winter months, levels average less than 7 mgd, but climb to nearly 11 mgd during summer months. Average water production exceeds 10 mgd during peak days in summer. Water usage frequently in the months of June through August exceeds 200 gpcd while consumption in the months of October through April is less than 150 gpcd.

City of El Centro 2010 Urban Water Management Plan

2010 Pumping Records	Total Monthly Flow (gallons)	Average Daily Flow (gpcd)
January	161,960,000	115

Water Conservation Bill of 2009 (SBX7-7)

The Water Conservation Bill of 2009 (SBX7-7) is one of four policy bills enacted by the California legislature as part of the November 2009 Comprehensive Water Package (Special Session Policy Bills and Bond Summary). The Water Conservation Bill of 2009 provides the regulatory framework to support the statewide reduction in urban per capita water use described in the 20x2020 Water Conservation Plan (DWR and others 2010). It also addresses agricultural water use; and commercial, industrial, and institutional (CII) water use. **Method 3** was used to calculate the target per capita water use. Calculations for Method 1 are shown for information only.

Before California can achieve the Final 2020 Statewide Target of 154 GPCD, each water supplier must determine and report its existing baseline water consumption and

establish either its own or cooperative targets. This reporting is to begin with the 2010 UWMP, as required by the Water Conservation Bill of 2009.

SBX7-7 describes what is required of water suppliers to identify their water conservation targets and track their progress toward achieving those targets. It also requires that water suppliers document and report targets and progress in UWMPs (CWC §10608.20(e)).

Figure 39 - TABLE 11 Total water use

The water use projections required by Section 10631 shall include projected water use for single-family and multifamily residential housing needed for lower income households, as defined in Section 50079.5 of the Health and Safety Code, as identified in the housing element of any city, county, or city and county in the service area of the supplier (10631.1(a)).

The website City-Data.com provides information regarding poor and low income residents. For the City of El Centro, an estimated 23% of the total population was below the poverty level in 2009.

<http://www.city-data.com/poverty/poverty-El-Centro-California.html>

The following table is from the Housing Element of the City of El Centro's General Plan:

**HOUSEHOLDS BY INCOME CATEGORIES
STATE OF CA INCOME LIMITS TABLES FOR CITY OF EL CENTRO
2008 AMI FOR IMPERIAL COUNTY = \$53,800**

Income Category	Income Range	Percent (%)	Households
Extremely Low	Less Than \$16,140	18.8	2,404
Very Low	\$16,141 - \$26,900	14.0	1,789
Low	\$26,901 - \$43,040	19.8	2,532
Moderate	\$43,041 - \$64,560	22.7	2,902
Above Moderate	Greater Than \$64,561	24.7	3,158

For the year 2008, extremely low income represents 18.8 percent and very low represents 14.0 percent of the total households. Using these percentages against the projected demand of Single Family and Multi-Family households, the following are the projected low income demands:

Table 8 Low-income projected water demands				
Low Income Water Demands¹	2015	2020	2025	2030
Single-family residential	1,416	1,600	1,743	1,920
Multi-family residential	137	155	167	188
Total	1,554	1,755	1,910	2,108
<i>Units (circle one): acre-feet</i>				
<i>¹Provide demands either as directly estimated values or as a percent of demand.</i>				

Figure 40 - TABLE 8 Low-income projected water demands

Water Demand Projections

Urban water suppliers that rely upon a wholesale agency for a source of water shall provide the wholesale agency with water use projections from that agency for that source of water in five-year increments to 20 years or as far as data is available. The wholesale agency shall provide information to the urban water supplier for inclusion in the urban water supplier's plan that identifies and quantifies, to the extent practicable, the existing and planned sources of water as required by subdivision (b), available from the wholesale agency to the urban water supplier over the same five-year increments, and during various water-year types in accordance with subdivision (c). An urban water supplier may rely upon water supply information provided by the wholesale agency in fulfilling the plan informational requirements of subdivisions (b) and (c) (10631(k)).

Table 12 Retail agency demand projections provided to wholesale suppliers, in acre-feet						
Wholesaler	Contracted Volume³	2010	2015	2020	2025	2030
Imperial Irrigation District	No Contract	8,029	11,198	12,374	13,540	14,705

Figure 41 - TABLE 12 Retail agency demand projections provided to wholesale suppliers

The above figure includes estimates for demand projections in five-year intervals for the City until 2030 in acre-feet. The estimates are based on projected population growth and per capita water demand. These demands are provided to the IID for planning purposes.

The City does not have a contract with Imperial Irrigation District that limits the amount of water available to the City.

Water Use Reduction Plan

Urban wholesale water suppliers shall include in the urban water management plans . . . an assessment of their present and proposed future measures, programs, and policies to help achieve the water use reductions required by this part (10608.36). Urban retail water suppliers are to prepare a plan for implementing the Water Conservation Bill of 2009 requirements and conduct a public meeting which includes consideration of economic impacts (CWC §10608.26).

The City has conservation guidelines² for the requirements found in Section 29-142 of the City Zoning Ordinance and in state legislation under Assembly Bill 1881 that apply to commercial, industrial and tenant occupied residential property that require landscaping greater than 2,500 square feet and homeowner landscaping greater than 5,000 square feet. While for the most part water conservation guidelines only apply to large landscaping projects, the City encourages its application to smaller scale projects in order to conserve water.

The following policies are part of the City's General Plan, in the Conservation/Open Space Element. There are no official Demand Management Measures (DMM):

Policy 2.1: Coordinate water quality and supply programs with responsible water agencies.

Policy 2.2: Develop and implement standards for site design, storm water management, planting, irrigation and maintenance.

Policy 2.3: Promote water conservation by El Centro residents, businesses, agriculture, and government to reduce overall demand for water.

Policy 2.4: Use recycled water for irrigation.

Policy 2.5: Utilize drought tolerant materials in the design of parks, recreation facilities and detention basins.

² Landscaping and Water Conservation Guide, City of El Centro

Section 4 - System Supplies

Water Sources

Identify and quantify, to the extent practicable, the existing and planned sources of water available to the supplier over the same five-year increments described in subdivision (a) (10631(b)).

If the water supplier is a retailer, indicate each wholesale supplier, if more than one. ³ Indicate the full amount of water					

Figure 43 – TABLE 17 Wholesale supplies – existing and planned sources of water

The City of El Centro has been supplying potable drinking water since the early years of the 1900's when water became available from the Colorado River. El Centro receives its drinking water from the Colorado River via the Imperial Irrigation District's (IID) All-American Canal and the Central Main Canal that run south of the city limits. The South Date Canal and the Dahlia Lateral Number 1 run north from the Central Main Canal and supply the water treatment facility. The raw water is stored in reservoirs until undergoing treatment.

The City of El Centro depends solely on the Colorado River for surface water inflows, supplied by the Imperial Irrigation District. The Imperial Irrigation District imports the raw Colorado River water and distributes it to the City and for agricultural purposes. Water from agricultural drains, the New and Alamo Rivers are high in total dissolved solids and other contaminants and are unsuitable for potable water use.

The City treats the raw surface water to meet state and federal drinking water standards before distribution.

Agricultural Drains

As part of its operating system, the IID maintains an extensive drainage system. Agricultural and storm water drainage is provided by the Alamo and New Rivers, over 1,405 miles of IID open drains and drainage pumps and over 34,400 miles of landowner tile drains. The ultimate repository for drainage water from the IID is the Salton Sea. With a surface area of about 383 square miles (or 245,000 acres), it is California's largest lake. The Salton Sea receives approximately 1,100,000 acre-

feet of drainage flows annually (since 2003) from Imperial, Coachella and Mexicali Valleys, as well as rainfall, storm runoff from the surrounding mountains and groundwater inflow.

There are three general categories which describe the surface water in Imperial Valley. These are freshwater, brackish water, and saline water. The freshwater (with TDS generally less than 1,000 ppm) include the All-American Canal and other canals and laterals which deliver irrigation water to the agricultural fields within the County. The brackish waters (with TDS in the range of 2,000 to 4,000 ppm) include the Alamo River, New River and the agricultural drains that flow into these rivers or directly into the Salton Sea.

The Salton Sea represents the saline water category. Salinity concentrations have been rising and are currently higher than ocean water (the Salton Sea's current TDS was approximately 53,000ppm in 2010 vs. an average of 34,000ppm for ocean water). The Salton Sea evaporates between eight and nine feet per year. The surface waters in Imperial Valley thus pass through a salinity gradient from the Colorado River to the Salton Sea.

This regional salinity gradient exists because of the high evaporation of the Imperial Valley, high temperatures, low annual rainfall, and continual leaching of salts from irrigated areas due to the high salinity of the Colorado River Water (approximately 750ppm). Evapotranspiration is water transported and evaporated from plants and surrounding soil surfaces. Although water is continually evaporated from the major canals, this evaporation represents a relatively minor increase in dissolved solids concentration because of the short residence times within the water conveyance system.

Normal evapotranspiration rates from the irrigated fields from efficient irrigation practices substantially reduce the amount of water and increase the concentration of salt entering the drainage system. For these reasons and due to salinity within the soils, a 300% to 500% increase in total dissolved solids concentration is normal within the Imperial Unit as water is efficiently applied to agricultural lands from the All-American Canal and is conveyed to the IID drains, the New River and the Alamo River, and eventually to the Salton Sea.

The increase in salinity is extremely important because it affects the aquatic

ecosystems. However, salinity is not the only water quality issue. The intensive irrigation in the valley presents the potential for the introduction of agricultural chemicals, such as pesticides and herbicides, into downstream waters. Field erosion and dredging activities also result in siltation in the New and Alamo Rivers and the Salton Sea. The bacteriological quality of these waters is also a concern because these streams receive locally generated municipal waste discharges, in addition to the waste load entering the United States from Mexico.

New River

The New River originates in Mexico, and flows northward across the International Boundary into Imperial Valley.. The flow continues through the Imperial Valley and ultimately discharges into the Salton Sea. The primary purpose of the New River is to convey agricultural drainage in the Imperial and Mexicali valleys to the Salton Sea. A corollary use of the New River is to convey treated community and industrial wastewaters. This corollary use is strictly controlled in the Imperial Valley by waste discharge requirements prescribed and enforced by the California Regional Water Quality Control Board. However, Mexico's corollary use of the New River is largely ignored and uncontrolled.

Mexico discharges raw and inadequately treated sewage, toxic industrial wastes, garbage and other solid wastes, animal wastes, and geothermal wastewaters out of the Mexicali area of Mexico and into the Imperial Valley. This process has continued for over forty years, resulting in the on-going pollution of the New River at the International Boundary. As Mexico's industry and population continue to grow, these problems have a high potential to increase if corrective measures are not taken.

Until August of 1983, the problem of Mexico polluting the New River had been the responsibility of United States Section of the International Boundary and Water Commission (IBWC), a joint United States/Mexico federal agency with responsibility for dealing with border water and sanitation problems between the two nations.

Over a period of thirty years, the California Regional Water Quality Control Board made several representations to the United States Commissioner on the IBWC to obtain corrections to the problem. Since 1975, the California Regional Water Quality Control Board has been monitoring water pollution of the New River to identify the pollutants actually coming from Mexico. This information is presented to the United

States Commissioner to aid and encourage Mexico in implementing corrective measures.

In August of 1980, Minute No. 264 to the Mexico-American Water Treaty was signed, which specified time schedules for completing work that was to result in a full cleanup of the river. In addition, minimum water quality standards were specified for New River water quality at the International Boundary. Mexico has been in violation of practically all of the specified schedules and standards since Minute No. 264 went into effect in December of 1980. There is no evidence that Minute No. 264 has had any influence on actions in Mexico to clean up the river.

In July of 1983, the California Regional Water Quality Control Board conducted an investigation. The purpose of the investigation was to determine the type(s) and extent of waste discharges into the New River and its tributaries from Mexico so that possible corrective action could be considered and pursued. The investigation identified problems that must be addressed to obtain adequate corrections. These problems included:

1. City sewer lines which are not connected to the City's main sewer system discharging raw sewage to the river;
2. Breakdowns in the sewer system resulting in the discharge of raw sewage to the river;
3. Discharge of wastes to the river by septic tank pumpers;
4. Discharge of wastes to the river from adjacent unsewered residences;
5. Discharge of untreated industrial wastes to the river including highly toxic chemicals wastes, many of which are on the Environmental Protection Agency's list of 129 priority pollutants and some of which are carcinogens;
6. Inadequate treatment of sewage and industrial wastes by Mexicali, whose sewage treatment plant consists of nothing more than raw sewage lagoons;
7. Location of the City's garbage dump such that refuse is disposed of directly into the river water;
8. Discharges of untreated wastes from a slaughterhouse, dairy, and hog farms;
9. Discharges from residential hog and cattle pens located adjacent to the river and its tributaries; and
10. Discharge of geothermal wastes to the river.

In August of 1983, a United States/Mexican Agreement for protection and improvement of the environment in the border area was signed by the Presidents of Mexico and the United States. Under this agreement, responsibility for border environmental problems, including the New River pollution problem, was transferred from the International Boundary and Water Commission to the United States Environmental Protection Agency for the United States, and to the Mexican Secretariat de Desarrollo Urbano y Ecologia (SDUE) for Mexico. Since this transfer of responsibility, progress has been slow and it is questionable if the agreement has served any useful purpose in controlling pollution in the New River.

In April of 1987, Minute No. 274 to the Mexican-American Water Treaty was approved by the United States and Mexico. The minute provided for a \$1.2 million United States/Mexico jointly funded project to construct certain works in Mexico to reduce pollution in the New River. Although this project is just a step towards resolving the pollution problems of the New River, it sets a precedent for the involvement of the United States in the implementation of corrective actions within Mexicali.

According to the International Boundary and Water Commission of the United States, additional projects are needed to help reduce water pollution from Mexico. Mexico and the United States are currently negotiating measures to solve the problem. Upon agreement between both governments, a new Minute will be approved and added to the Mexican-American Treaty to supersede Minute No. 274. The main goal of the new Minute would be to establish a long-term solution to the water pollution problem.

The Alamo River is also polluted with contaminants. A small amount of groundwater seepage from agricultural fields crosses into Imperial Valley from Mexico to the Alamo River and has low pollutant concentrations.

The main pollutants in the water are pesticides which get drained into the Alamo River during irrigation. However, the potential for polluting the Alamo River could increase not only from the pesticides contained in the water but from potential development at or near the Alamo River at the International Boundary, such as the new border crossing that has been constructed near the Alamo River as it crosses into the United States.

This new border crossing could create an urban sprawl effect in this area of Imperial Valley, which would increase drainage into the Alamo River. The Alamo River

currently has a small concrete culvert that passes underneath the All-American Canal which drains seepage water coming from Mexico. Additional flows could impact the river and present a financial burden to Imperial Valley and lead to environmental health problems.

An option proposed by the California Regional Water Quality Control Board has been to shunt the Alamo River into a drainage system which would eventually drain into the New River before it crosses into the United States. In order for this to happen, both governments must agree. Presently, nothing has been settled but further negotiations are currently being reviewed between the United States and Mexico, in hopes to minimize potential problems that could result from the development of the new border crossing.

Surface Water from the Colorado River

Water is supplied to the City from the All-American Canal through the Central Main Canal. The supply point for the water plant is the South Date Canal and the Dahlia Lateral Number 1. Both of these canals flow north from the Central Main Canal. The South Date Canal runs immediately east of the treatment facility and has capacity to deliver 22.6 million gallons per day (MGD) of untreated water to the plant.

The Dahlia Lateral Number 1, located west of the plant, is capable of supplying the plant with an additional 9.0 mgd. The Dahlia Lateral has been used as a water source more during the last few years. This is because it has fewer services drawing water from it than the South Date Canal. It maintains a steadier flow and is a more reliable source. The capacity of water delivery from the Dahlia Lateral is limited due to the size of gate 18A and the back pressure of the Lateral. The total amount of raw water that can currently be supplied to the City is 31.6 mgd (35,755 acre-feet per year).

Rainfall average is less than three inches per year and does not contribute to Imperial Irrigation District's water supply, although at times it may reduce agricultural water demand.

As the City grows and develops on existing agricultural land, theoretically there will be more supply of water available. Agriculture requires more raw water per acre than developed land.

Municipal water is not a large portion of the total water delivered by the IID. It represents only approximately three percent (3%) of the total water delivered. The total municipal use has not significantly changed since 2006. Figure 42 shows the total water delivered. Since the portion of water used by the municipalities is low compared to the overall use, it is not anticipated that there will be any shortage of raw water from the IID. The city's main constraint of raw water availability is in the raw water inlet piping capacity. As was mentioned earlier, the total amount of raw water that can currently be supplied by the IID to the City is 31.6 MGD (35,755 acre-feet per year) which is more than enough capacity for the foreseeable future.

Year	IID Net Consumptive Use Amount (Total Imperial Valley) (AF)	Total Municipal Use (AF)	Total Other Non-Agricultural Use (AF)	Total Agricultural Use (AF)
2010	2,363,800	50,819	54,749	2,258,232
2015	2,236,300	55,877	66,382	2,114,041
2020	2,316,300	61,397	78,015	2,176,888
2025	2,284,300	67,335	85,558	2,131,407
2030	2,279,300	71,233	93,101	2,114,966

Figure 44- IID Consumptive Use Amount vs. Total Municipal Use

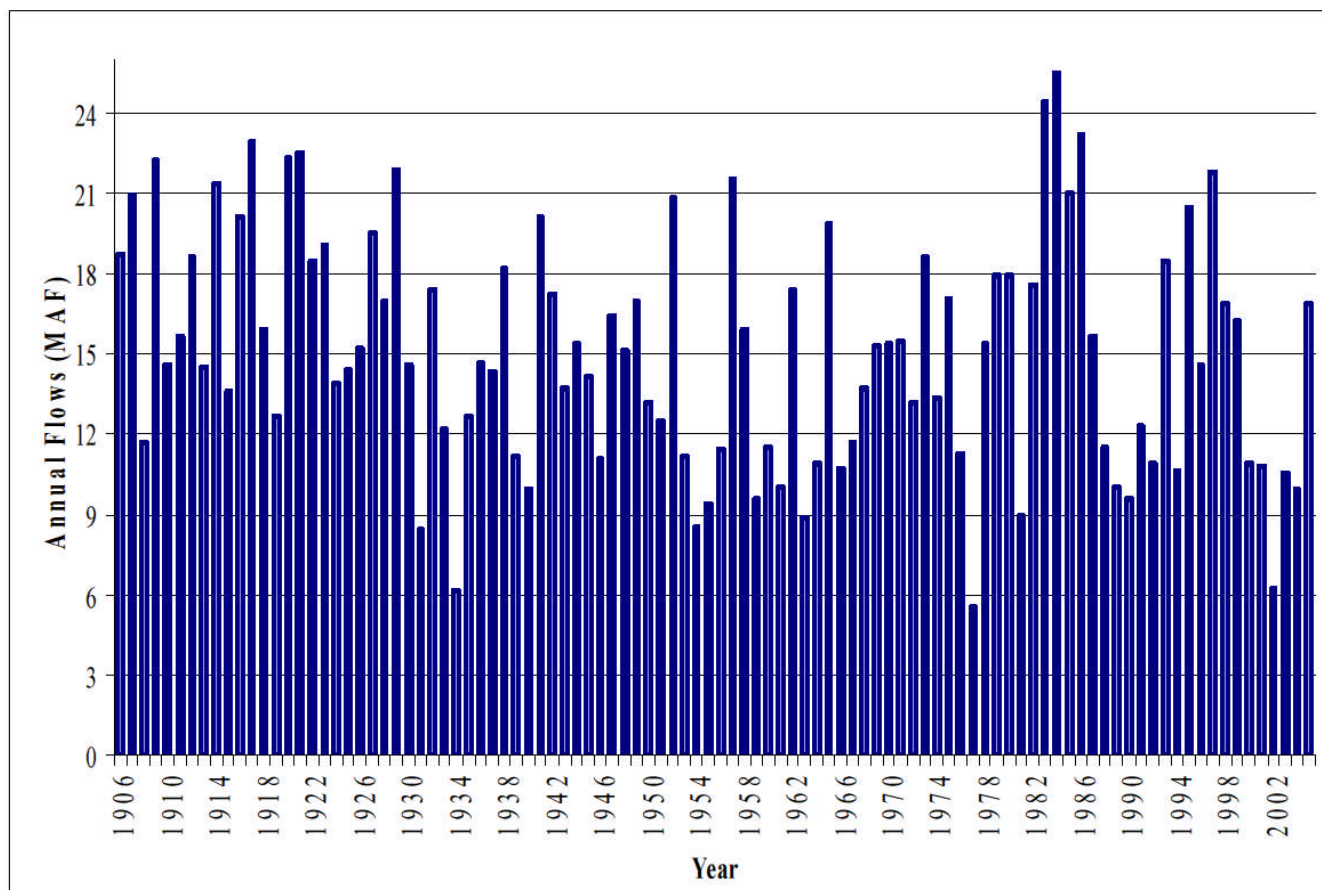

Figure 45 – Colorado River Annual Flows (MAF) 1906-2002

Colorado River Reliability

Under the Law of the River, IID has significant historical legal protections in place to maintain its 3.1 MAF Priority 3a water right to consumptive use of Colorado River water even during lower Colorado River flow periods.

Historical Data on the Colorado River Water Supply

The Colorado River flow at Lees Ferry has been gauged since 1921. By removing reservoir and diversion effects, the USBR has created a “natural flow” record for this site. The long-term (1906- 2004) average natural flow is estimated to be about 15.1 MAF based on the gage record. The annual natural flow records are shown in Figure 2. A few important points should be noted from the natural flow record:

- (1) The period 1906-1930 and prior was the available gauge record when many of the Colorado River compacts were drafted. This period had a 10-year running average flow of about 17.0 MAF, which is higher than almost any other period in the gage record.
- (2) The 10-year running average from 1934 to 1984 was almost always less than 15 MAF, meaning that the 1922 Compact apportioning 7.5 MAF to the Upper and Lower Basins could not have been fully satisfied for most of this 50-year period.
- (3) Allocations from the Colorado River total 16.5 MAF, divided as 7.5 MAF each to the Upper and Lower Basins, and 1.5 MAF to Mexico. The long-term average natural flows from the gauge record are less than these total allocations.

Imperial Irrigation District Water Use

The Imperial Irrigation District provides wholesale water service. Demand for water in the Imperial Unit service area is divided into three basic categories: agricultural, municipal, and industrial. Presently the Imperial Irrigation District delivered approximately 97% of its annual flows to agricultural water users, 2% to municipalities, and 1% percent for industrial purposes.

The Imperial Irrigation District's consumptive use values include the total use of raw water in the Imperial Unit. These consumptive use values include agriculture, small acreage, service laterals, municipalities, industrial, losses and unaccounted raw water. There is no available data that completely distinguishes between these uses of raw water.

Water distribution systems “lose” water during distribution for several reasons. Specific water distribution “losses” depend on the type of distribution system. A piped water distribution system can lose water due to pipe failures or leaks. Open channels, ponds, reservoirs, and water basins can “lose” water from seepage through the soil, surface evaporation into the air, and plant consumptive use.

An open channel, gravity flow water distribution system has operational spill. Operational spills are excess flows discharged from a channel into a drain or other sump (Salton Sea). Operational spills can result from: carriage water that is required

to fill and empty the reaches of sloping channels; increases in water user flexibility for water ordering and delivery scheduling; and terminating water deliveries during rainfall events, storm runoff, and flood flows.

The Imperial Irrigation District has an open channel gravity flow water distribution system. Its water distribution system losses result from three major conditions: seepage, operational spills, and evaporation. The Imperial Irrigation District's water distribution system losses have been reduced through the years by numerous water conservation and demand management programs and projects. The demand management programs and projects are described in detail in the Imperial Irrigation District Demand Management Section of this plan.

Agricultural Water Use in the Imperial Valley

Over 120 types of crops are grown in the Imperial Valley. Most relevant to the Water Element is an examination of the various crop types, the acreage dedicated to each and the demand for irrigation water generated by each crop per acre of cultivation. Water demand is provided below on a net consumption basis and is based upon historical acreage and water use data. Major water consuming crops include alfalfa (5.20 ac.ft./acre), asparagus (4.12 ac.ft./acre), cotton (3.45 ac.ft./acre), and tomatoes (2.23 ac.ft./acre). More efficient crops include carrots (1.21 ac.ft./acre), squash (1.58 ac.ft./acre), and barley (1.64 ac.ft./acre). Since the 2000's 500,000 acres are in cultivation over the year including double cropping. Crops grown on this acreage consume approximately 1,500,000 acre-feet per year. Figure 46 shows the historical average of individual crop acreage and water use in Imperial Valley over a ten year period.

Approximately ninety-seven percent of the water imported into Imperial Valley from the Imperial Irrigation District is used for agricultural purposes. Imperial Irrigation District supplies more than 2,500,000 acre-feet of water annually for primarily agricultural purposes to its customers in Imperial Valley, to just over 500,000 acres of irrigated farmland (double cropped).

Crop	Area (Acres)	Water Use (af)

Water Rights

IID has a longstanding right to import Colorado River water, and holds legal title to all its water and water rights in trust for landowners and water users within the District (California Water Code §§20529 and 22437; Bryant v. Yellen, 447 U.S. 352, 371 (1980), fn.23.). These date from as early as 1885, when a number of individuals, as well as the California Development Company, made a series of appropriations of Colorado River water pursuant to stipulations of California law for use in the Imperial Valley.

The right to water from the Colorado River is governed by numerous compacts,

state and federal laws, court decisions and decrees, contracts, and regulatory guidelines collectively known as the "Law of the River." These documents apportion the water and regulate the use and management of the Colorado River among the seven basin states and Mexico. A brief review of those parts that impact the Imperial Irrigation District follows:

Colorado River Compact (1921)

In 1921, representatives from the seven Colorado River basin states, with the authorization of their legislatures and at the urging of the federal government, began negotiations regarding the distribution of water from the Colorado River. In November of 1922, the representatives from the upper basin states (Colorado, New Mexico, Utah and Wyoming) and lower (Arizona, California, and Nevada) signed the Colorado River Compact (Compact), an interstate agreement giving each basin perpetual rights to annual apportionments of 7.5 million acre-feet (MAF) of Colorado River water.

Boulder Canyon Project Act (1928)

The Compact was made effective by provisions in the 1928 Boulder Canyon Project Act, which authorized construction of Hoover Dam and the All-American Canal, and served as the United States' consent to accept the Compact. Officially enacted on June 25, 1929, through a Presidential Proclamation, this act resulted in ratification of the Compact by six of the basin states and required California to limit its annual consumptive use to 4.4 MAF of the lower basin's apportionment plus not less than half of any excess or surplus water unapportioned by the Compact. Arizona refused to sign and subsequently filed a lawsuit. California abided by this federal mandate through the implementation of its 1929 Limitation Act. The Boulder Canyon Project Act further authorized the Secretary to "contract for the storage of water... and for the delivery thereof for irrigation and domestic uses," and further defined the lower basin's 7.5 MAF apportionment split, with an annual allocation of 0.3 MAF to Nevada and 2.8 MAF to Arizona. While the three states never formally accepted or agreed to these terms, a 1964 Supreme Court decision (*Arizona v. California*, 373 U.S. 546) declared their consent to be inconsequential since the Boulder Canyon Project Act was authorized by the Secretary.

California Seven-Party Agreement (1931)

Following implementation of the Boulder Canyon Project Act, the Secretary requested that California make recommendations regarding distribution of its allocation of Colorado River water. In August 1931, under chairmanship of the State Engineer, the California Seven-Party Agreement was developed and authorized by the affected parties to prioritize California water rights. The Secretary accepted this agreement and established these priorities through General Regulations issued in September of 1931. The first four priority allocations account for California's annual apportionment of 4.4 MAF, with agricultural entities using 3.85 MAF of that total. The remaining priorities are defined for years in which the Secretary declares that excess waters are available.

Arizona v. California US Supreme Court Decision (1964, 1979)

In 1963, the Supreme Court issued a decision settling a 25-year-old dispute between Arizona and California, which stemmed from Arizona's desire to build the Central Arizona Project to enable use of its full apportionment. California argued that Arizona's use of water from the Gila River, a Colorado River tributary, constituted use of its Colorado River apportionment, and that California had developed a historical use of some of Arizona's apportionment, which, under the doctrine of prior appropriation, precluded Arizona from developing the project.

The Supreme Court rejected California's arguments, enjoined the Secretary from delivering water outside the framework of apportionments defined by the law, and mandated the preparation of annual reports documenting the consumptive use of water in the three lower basin states. In 1979, the Supreme Court issued a Supplemental Decree which addressed Present Perfected Rights (PPRs) referred to in the Colorado River Compact and in the Boulder Canyon Project Act. These rights are entitlements essentially established under state law, and have priority over later contract entitlements.

On March 27, 2006, the Supreme Court issued a Consolidated Decree to provide a single reference to the provisions of the original 1964 decrees and several subsequent decrees (1966, 1979, 1984, and 2000) that stemmed from the original ruling. This decree also reflects the settlements of the federal reserved water rights claim for the Fort Yuma Indian Reservation.

Colorado River Basin Project Act (1968)

Congress authorized construction of a number of water development projects in both the upper and lower basins, including the Central Arizona Project (CAP) in 1968. The act made the priority of the CAP water supply subordinate to California's apportionment in times of shortage, and directed the Secretary to prepare, in consultation with the Colorado River Basin states, long-range operating criteria for the Colorado River reservoir system.

Quantification Settlement Agreement (QSA) and Related Agreements

The Quantification Settlement Agreement (QSA) and Related Agreements that became effective in October 2003 are a set of inter-related contracts that settle certain disputes among the United States, the State of California, Imperial Irrigation District (IID), Metropolitan Water District (MWD), Coachella Valley Water District (CVWD) and the San Diego County Water Authority (SDCWA) that became effective in October 2003. The agreements resolve, for a period of 35 to 75 years, issues regarding the reasonable and beneficial use of Colorado River water; the ability to conserve, transfer and acquire conserved Colorado River water; the quantification of Priorities 3 and 6 within California for the use of Colorado River water; and the obligation to implement and fund environmental impact mitigation related to the above.

Conserved water transfer agreements between IID and SDCWA, IID and CVWD and IID and MWD are all part of the QSA and Related Agreements. These contracts identify the conserved water volumes and transfer schedules for IID along with price and payment terms. As specified in the agreements, IID will transfer to SDCWA up to 200,000 AFY, and to CVWD up to 103 AFY, and MWD 105,000 Acre AFY of water conserved from delivery system improvements and on-farm efficiency improvements, all in return for payments totaling billions of dollars. In addition, IID will transfer up to 67,000 AFY of conserved water from the lining of the All-American Canal to SDCWA and certain San Luis Rey Indian Tribes 16,500 AFY in exchange for the payment of all lining project costs and a grant to IID of certain rights to use the conserved water.

As a result of the QSA and Related Agreements, IID will be able to more efficiently deliver Colorado River water to the Imperial Valley. Imperial Valley water users will

be able to more effectively irrigate their farms, thus preserving Imperial Valley water rights and agricultural output, with costs and impacts compensated by the payments to IID for the conserved water. IID will face minimum future risk from challenges to the purpose or reasonableness of IID's water use, and thus enable the Imperial Valley to rely upon the large senior Colorado River water rights IID possesses.

In short, the QSA and Related Agreements provide the methods and the means to allow IID to elevate its Colorado River water use to efficient 21st Century standards and ensure the continued availability.

In October 2003, all the water districts, the State and the Interior reached agreement on the final terms of the QSA and related agreements. For closure among State interests, three elements proved critical. First, the IID, SDCWA, CVWD and MWD agreed to provide four sources of economic support for Salton Sea restoration: (1) conditional new transfers between the IID/CDWR and CDWR/MWD as described in the succeeding paragraph; (2) conditional reassignment of mitigation water to CDWR for resale to MWD at a price of \$250/AF (in 2003 dollars) per acre-foot delivered to the Salton Sea, provided that the reassignment is consistent with the restoration of the Salton Sea and satisfies other conditions; (3) a joint contribution by the IID, CVWD, and SDCWA to the Salton Sea Restoration Fund established by the California Legislature with payments totaling a present value of \$30 million; and (4) payment by MWD to a Salton Sea Restoration Fund of \$20 (in 2003 dollars) per acre-foot for all special surplus water MWD receives from the reinstatement of the Interim Surplus Guidelines.

As part of the final negotiations, the IID and CDWR entered into a conditional agreement for the IID to sell CDWR an aggregate of 800,000 acre-feet of conserved water, through the year 2017 for delivery to the Salton Sea as mitigation for impacts of the SDCWA transfer. CDWR is responsible for all mitigation costs, including environmental and any socioeconomic impacts from land fallowing used to make water available to CDWR. The water will be sold to CDWR at a price of \$175/acre foot (in 2003 dollars). Therefore, the price received by the IID in any year equals \$175/acre foot adjusted by changes in a contractually defined price index from 2003 to the year of delivery.

Figure 52 – IID QSA Delivery Schedule

QSA by and among IID, MWD, and CVWD, Exhibit C, [http://www.iid.com/Media/Quantification-Settlement-Agreement\(QSA-among-IID,-MWD,-and.pdf](http://www.iid.com/Media/Quantification-Settlement-Agreement(QSA-among-IID,-MWD,-and.pdf) , (p 39 of 44)

Canal Lining Projects

In 1986, Congress passed Public Law 100-675 that governs the allocation of water conserved by the lining of the All-American and Coachella canals and assigns responsibility for the repayment of costs. Water conserved by these projects was to be made available to the IID, CVWD, and MWD in accordance with the priorities established under the Seven-Party Agreement. Parties who use the conserved water were to reimburse the party constructing the project for an apportioned share the amortized capital costs, plus an apportioned share of the costs of operation, maintenance, and any net costs the lining projects impose on IID. In 1988, Congress authorized the Secretary of the Interior to develop a well field or construct a new lined canal or line previously unlined portions of the All-American Canal in southeastern California, and to enter into an agreement with the MWD and/or certain other California water agencies to fund the lining project. The canal is owned by the United States. An estimated 67,700 acre-feet of water a year that was lost by seepage into groundwater from unlined portions of the canal is expected to be saved by this project and made available for use according to the terms of the QSA and related agreements.

On September 25, 1998, the California Legislature passed Senate Bill 1765 authorizing the sum of \$200 million be used by the Director of CDWR to finance and arrange for lining portions of the All-American and Coachella Canals. The “Agreement for the Funding of the All-American Canal Lining Project” was developed by the IID and CDWR, and approved by the Board of Directors of the IID on July 24, 2001. Pursuant to the agreement with CDWR, CDWR will reimburse the IID for all costs up to \$126 million associated with the canal lining project. The project also qualifies for an additional \$9.5 million of Proposition 50 funding approved in the November 2002 general election. The total amount of funding reserved for the canal lining project from the State of California is \$135.5 million.

All-American Canal

The All-American Canal (AAC) is the Imperial Valley's lifeline from the Colorado River. In 2008, 2,878,320 acre-feet of Colorado River water was accounted for by water balance through the All-American Canal to nine cities and 475,000 acres of farmable lands throughout the Imperial Valley.

Considered an engineering marvel, even by today's standards, the 80-mile gravity-

flow All-American Canal begins at Imperial Dam on the Colorado River about 20 miles northeast of Yuma, Arizona. Dropping a total of 175 feet between Imperial Dam and IID's Westside Main Canal, the All-American Canal extends south and then west, parallel to the Mexican/American border much of the way.

Crossing 14 miles of sand dunes on the east side of the Imperial Valley, the All-American Canal ends in the southwest corner of the Imperial Irrigation District's delivery area. The AAC until 2009 was unlined, resulting in an estimated 67,700AFY in seepage. The All-American Canal Lining Project included 23 miles of concrete lining.

The Project consisted of the planning; environmental compliance and permitting activities; preparation of schedules, plans, specifications and cost estimates; administration; design; construction; and implementation of environmental mitigation measures required to construct the 23-mile concrete lined canal parallel to the existing earthen canal, from one mile west of Pilot Knob to Drop 3. The new concrete lined section of the AAC is expected to conserve 67,700 acre-feet per year of Colorado River water that was historically lost to seepage, mainly into Mexico.

The new section of concrete lined AAC was constructed parallel to the existing AAC alignment using conventional construction methods and now permitted the current unlined section of the AAC to remain in service and to provide normal water deliveries to IID customers during construction. IID operates and maintains the Project in accordance with its existing contract with USBR. Construction was completed in 2009.

Colorado River Environmental Considerations

Several fish species and other wildlife species either directly or indirectly have the potential to affect Colorado River options, thus changing power operations and the amount of water deliveries to the lower basin. A number of species that are on either endangered or threatened lists under the Endangered Species Act are present in the area of the Lower Colorado River, including among others, the bonytail chub, razorback sucker, southwestern willow flycatcher and Yuma clapper rail. To address this issue, a broad-based State/Federal/tribal/private regional partnership has been formed, which includes water, hydroelectric power and wildlife management agencies in Arizona, California and Nevada. The objective is to accommodate current water diversions and power production and optimize

opportunities for future water and power development while working toward the conservation of habitat and toward recovery of the endangered species. These efforts also have the objective of reducing the likelihood of additional “threatened/endangered” species listings.

Operations of the Water System

The Water Control Section of the IID’s Water Department is responsible for the transmission of water through the main canal system and its diversion to the laterals for distribution to the users. Water distribution is a complicated task that involves adjusting the appropriate check, delivery and other structures. There are approximately 3,400 check structures and 5,600 irrigation delivery structures within the system. A coordinated procedure has evolved to handle this complex distribution process.

Groundwater

Identify and quantify, to the extent practicable, the existing and planned sources of water available to the supplier over the same five-year increments described in subdivision (a) (10631(b)).

Table 18 Groundwater — volume pumped

<i>Units (circle one): acre-feet per year</i> <i>Include future planned expansion</i>					

Figure 54 - TABLE 19 Groundwater - volume projected to be pumped

Groundwater is generally unusable for municipal potable water supplies or irrigation in the Imperial Valley. The salinity, or total dissolved solids count, is too high.

The deepest groundwater is in some cases is believed to be moderately altered ocean water. Above this level, the water may consist of residuals from prehistoric fresh water lakes that filled the Salton Trough. Waters at this level vary from low to moderate salinity. The next higher layers are high temperature, and in places highly saline waters.

In the central part of the Imperial Valley, the groundwater has a higher salinity than the Colorado River water, which has an approximate salinity of 750mg/L. Most wells had total dissolved solids concentrations of between 1,000 and 3,000 mg/L. The ionic composition of the water in the central part of the valley is similar to that of the East Mesa. However, as the total dissolved solids concentration increases, the ionic composition becomes more dominated by sodium chloride. The pH of these waters is usually slightly basic, with an occasional value less than seven.

In the western section of the valley, water quality varies widely. Almost all of the wells in Coyote Valley have total dissolved solids concentrations below 500 mg/L; however, West Mesa wells have levels between 1,800 and 5,200 mg/L.

The shallow aquifers beneath the Imperial Valley are affected by canal seepage and deep percolation of applied irrigation water (raw Colorado River water) from agricultural fields.

Percolation from agricultural fields has resulted in local salinities higher than Colorado River water because of the leaching of salts from these fields. In other areas, mounds of good quality fresh water have resulted from seepage from irrigation canals. This has occurred significantly in the unlined major canals and the All-American, East Highline, and Coachella canals.

Waters within the shallow aquifers of the Salton Trough generally move at right angles to contours lines, and towards the Salton Sea. Based on pumping data and water studies on various wells, groundwater is from six to eight feet below the ground surface level throughout most of the Imperial Valley.

The deep water reservoir underlying Imperial Valley has been estimated at 1.1 billion to 3.0 billion acre-feet, with total recoverable water estimated to be about twenty percent of the water in storage.

(Provide a) copy of any groundwater management plan adopted by the urban water supplier, including plans adopted pursuant to Part 2.75 (commencing with Section 10750), or any other specific authorization for groundwater management (10631(b)(1)).

There is no groundwater management plan for the City.

(Provide a) description of any groundwater basin or basins from which the urban water supplier pumps groundwater (10631(b)(2)).

The City does not use groundwater.

For those basins for which a court or the board has adjudicated the rights to pump groundwater, (provide) a copy of the order or decree adopted by the court or the board (10631(b)(2)).

The City does not use groundwater.

(Provide a) detailed description and analysis of the location, amount, and sufficiency of groundwater pumped by the urban water supplier for the past five years. The description and analysis shall be based on information that is reasonably available, including, but not limited to, historic use records (10631(b)(3)).

The City does not use groundwater.

(Provide a) detailed description and analysis of the amount and location of groundwater that is projected to be pumped by the urban water supplier. The description and analysis shall be based on information that is reasonably available, including, but not limited to, historic use records (10631(b)(4)).

The City does not use groundwater.

Transfer or Opportunities

Describe the opportunities for exchanges or transfers of water on a short-term or long-term basis (10631(d))

The City does not have plans to exchange or transfer water. All agencies within the Imperial Valley utilize the same raw source water from the Imperial Irrigation District. However, if connected to another water system there would be the benefit of an emergency water supply. The City will evaluate the potential for long term possibilities.

Table 20 Transfer and exchange opportunities			
Transfer agency	Transfer or exchange	Short term or long term	Proposed Volume
None	0	0	0
Total	0	0	0
Units (circle one): acre-feet per year			

Figure 55 - TABLE 20 Transfer and exchange opportunities

Development of Desalinated Water

Describe the opportunities for development of desalinated water, including, but not limited to, ocean water, brackish water, and groundwater, as a long-term supply (10631(i)).

There are no plans to use and treat the brackish groundwater as a long-term supply in the Imperial Valley.

There are no plans for the City of Imperial to use and treat the brackish groundwater as a long-term supply in the Imperial Valley. There are no feasible opportunities for the City of Imperial to independently development of desalinated water sources within the planning horizon of the 2010 UWMP, because of the supply availability and cost effectiveness of treating surface water from the Colorado River. If it becomes financially feasible in the future, there may be consideration for desalination of brackish groundwater and drain water on a regional basis.

Recycled Water Opportunities

Provide, to the extent available, information on recycled water and its potential for use as a water source in the service area of the urban water supplier. The preparation of the plan shall be coordinated with local water, wastewater, groundwater, and planning agencies that operate within the supplier's service area (10633).

Recycled Water Feasibility

The City of El Centro provides sewer service and has a wastewater treatment plant which produces secondary (includes de-nitrification) treatment level wastewater. Treated waste water is discharged to percolation ponds. The cost of the City's water supply is \$177 per acre foot (\$68 per acre foot for supply and \$109 per acre foot for treatment). The cost of a recycled water treatment and distribution system would

exceed \$500 per acre foot. Although it is not currently financially feasible for the City to provide the facilities for recycling wastewater, it may be financially feasible for new industry and geothermal and solar energy plants if part of a regional program and strategy to require use of such water as an alternative to using Colorado River Supplies, or if development of recycled water is subsidized with other state or federal funding

Treated wastewater does not meet Title 22 Standards, and no wastewater is recycled within the City's service boundary. The WWTP discharges the treated waste water to IID drainage canals, where it eventually enters the Salton Sea.

There are no other wastewater, treatment, discharge or recycle facilities or agencies within the City's service area.

There are potential uses for recycled water that include but is limited to: landscape irrigation, industrial reuse, wetlands, some agricultural uses (consistent with State regulations) and wildlife habitat enhancement. There are some recycled water projects that have been proposed in the Imperial Valley for use in Solar and Geothermal plants.

(Describe) the wastewater collection and treatment systems in the supplier's service area, including a quantification of the amount of wastewater collected and treated and the methods of wastewater disposal (10633(a)).

Wastewater Collection and Treatment in El Centro

The City Waste Water Treatment Plant (WWTP) manages wastewater collection and treatment for the City. All of the wastewater flows from the City (including storm water run-off), and is collected and treated at the WWTP. The WWTP treats an average of 3.5 million gallons per day (mgd).

Wastewater Treatment					
Treatment Plant Name	Location (City)	Average Daily (2010)	Maximum Daily (2010)	Year of Planned Build-out	Planned Maximum Daily Volume
WWTP	El Centro	4.0MGD	4.5 MGD	2040	8.0 MGD

The City of El Centro Wastewater Treatment Plant (WWTP) consists of a conventional

activated sludge treatment facility. The treatment facility started operation in 1957 with several treatment lagoons, and has been upgraded since to produce secondary treatment effluent with UV disinfection and sludge treatment. Overall the WWTP has adequate capacity for the current volume of wastewater produced by the City. Redundancy exists for treatment processes such as the sludge thickener and the sludge dewatering.

Treatment Process Description

The treatment plant is located in the northwestern part of El Centro on La Brucherie Rd. It receives wastewater from residential, commercial, and industrial discharges within the city and a county facility south of the city limits. Figure 1 shows a site plan of the treatment facility.

At present, the treatment plant receives an average flow of 4.0 mgd, with BOD5 and TSS concentrations of 253 mg/L and 207 mg/L respectively. The discharge permit requires 30 mg/L BOD and 30 mg/L TSS in the plant's effluent.. The plant's effluent is 8 mg/L BOD5 and 16 mg/L TSS. The treatment usually provides BOD5 removal efficiency of 97%, and TSS removal efficiency of 91%.

Preliminary treatment consists of a bar screen/washer/compactor equipment combination located at the main lift station, just upstream of the wet well. Wet screenings collected in the bar screen are washed and compacted to reduce their volume. Compacted solids are collected in a movable metal container, where they are stored prior to being disposed of in a private landfill.

Influent wastewater flow is measured through a magnetic flowmeter immediately before entering the influent distribution structure. Influent flow measurements are logged on a chart recorded at the control room. The flow is then distributed to the primary sedimentation basins.

Wastewater flows by gravity from the influent distribution structure into the primary sedimentation units. Each clarifier is the same size, with a 65-ft diameter and a side water depth (SWD) of 8.75 ft. Sludge treatment at the EC Wastewater Treatment Facility consists of thickening, anaerobic digestion, and dewatering. Primary and waste activated sludge are stabilized through digestion and excess water is removed before final disposal.

The El Centro Wastewater Plant utilizes Ultra Violet radiation for disinfection of the water prior to discharging. UV disinfection of wastewater is a physical process of transferring energy to cellular material of the organisms present. UV radiation is absorbed by the organisms and it has a damaging effect that prevents them from reproducing. When UV energy is absorbed by the organism, structural changes or damage occur that prevent their propagation.

(Describe) the quantity of treated wastewater that meets recycled water standards, is being discharged, and is otherwise available for use in a recycled water project (10633(b)).

Table 21 Recycled water — wastewater collection and treatment						
Type of Wastewater	2005	2010	2015	2020	2025	2030
Wastewater collected & treated in service area	1,460.0	1,533.0	1,752.0	2,007.5	2,372.5	2,555.0
Volume that meets recycled water standard	0	0	0	0	0	0
Units (circle one): million gallons per year						

Figure 56 - TABLE 21 Recycled water - wastewater collection and treatment

(Describe) the recycled water currently being used in the supplier's service area, including, but not limited to, the type, place, and quantity of use (10633(c)).

Table 22 Recycled water — non-recycled wastewater disposal

Indirect potable reuse		None	0	0	0	0
Other (user type)						
Total		0	0	0	0	0
<i>Units (circle one): acre-feet per year</i> ¹ <i>Technical and economic feasibility.</i> ² <i>Includes parks, schools, cemeteries, churches, residential, or other public facilities)</i> ³ <i>Includes commercial building use such as landscaping, toilets, HVAC, etc) and commercial uses (car washes, laundries, nurseries, etc)</i>						

Figure 58 - TABLE 23 Recycled water - potential future use

Since the QSA has been approved, recycled water may become more of a feasible option for new industry within the Imperial Valley. There is not enough water for IID to allocate to proposed renewable energy projects without developing new sources and/or policies. Although it is not currently financially feasible for the City to provide the facilities for recycling wastewater, it may be for new industry and geothermal and solar energy plants.

“IID Interim Water Supply Policy for Non-Agricultural Projects” dated 09/29/2009 (IWSP) currently designates up to 25,000 AFY of water to Non-Agricultural Projects within IID's water service area.

The City does not currently have the resources for administration, design and construction of the required facilities at the wastewater plant to treat the water to Title 22 reuse standards and distribute the water. However if the required facilities are funded by private industry and an agreement can be made with said industry over the lifespan of the facilities it may be feasible.

(Describe) the projected use of recycled water within the supplier's service area at the end of 5, 10, 15, and 20 years, and a description of the actual use of recycled water in comparison to uses previously projected pursuant to this subdivision (10633(e)).

There are currently no planned recycled water projects or recycled water use in the City for the next 20 years. It is technically feasible to treat the City's wastewater to Title 22 standards and distribute for recycled use. There are a number of uses that the recycled water can be used for locally, including golf courses, agriculture, irrigation, and industrial use. It is not, however, currently economically feasible for the city to construct recycled water facilities. Any potential to upgrade the wastewater facilities to produce recycled water depends completely upon grant funding or private financing and approved agreements between the City and developer(s). The Integrated Regional Water Management Plan (IRWMP) that is currently being developed will evaluate regional recycling opportunities and potential grant funding for projects consistent with the Imperial regional goal and objectives, and the State's preferences and priorities.

Table 24

Figure 59 - TABLE 24 Recycled Water - 2005 UWMP use projection compared to 2010 actual

(Describe the) actions, including financial incentives, which may be taken to encourage the use of recycled water, and the projected results of these actions in terms of acre-feet of recycled water used per year (10633(f)).

Table 25					
Methods to encourage recycled water use					
Actions	Projected Results				
	2010	2015	2020	2025	2030
Financial incentives					
None	0	0	0	0	0
Total	0	0	0	0	0
<i>Units (circle one): acre-feet per year</i>					

Figure 60 - TABLE 25 Methods to encourage recycled water use

There are no financial incentives because the city does not have the facilities to provide recycled water.

The city is open to discussions with future developers and industry regarding upgrading the wastewater treatment plant for recycled use; provided the cost of such improvements are covered by the developer and/or industry and a contract for services can be agreed upon by all involved parties for the life of the facility.

(Provide a) plan for optimizing the use of recycled water in the supplier's service area, including actions to facilitate the installation of dual distribution systems, to promote recirculating uses, to facilitate the increased use of treated wastewater that meets recycled water standards, and to overcome any obstacles to achieving that increased use (10633(g)).

A recycled water master plan has not been prepared for the City to date. Recycled water is not financially feasible at this time unless funded completely by a developer or industry. There are no current plans for installation of dual distribution systems, promotion of recirculating uses or to facilitate the increased use of treated wastewater that meets recycled water standard because it is not financially feasible at this time. The main obstacle for recycled water use is financial; upgrading the wastewater treatment facility and installing a dual distribution system is beyond the City's current resources.

The city will work with future (high water demand) developers and industry to promote the potential of funding the wastewater treatment plant upgrades and new purple pipe distribution systems.

Future Water Projects

(Describe) all water supply projects and water supply programs that may be undertaken by the urban water supplier to meet the total projected water use as established pursuant to subdivision (a) of Section 10635. The urban water supplier shall include a detailed description of expected future projects and programs, other than the demand management programs identified pursuant to paragraph (1) of subdivision (f), that the urban water supplier may implement to increase the amount of the water supply available to the urban water supplier in average, single-dry, and multiple-dry water years. The description shall identify specific projects and include a description of the increase in water supply that is expected to be available from each project. The description shall include an estimate with regard to the implementation timeline for each project or program (10631(h)).

Table 26 Future water supply projects								
Project name ¹	Projected start date	Projected completion date	Potential project constraints ²	Normal-year supply ³	Single-dry year supply ³	Multiple-dry year first year supply ³	Multiple-dry year second year supply ³	Multiple-dry year third year supply ³

<i>Units (circle one): acre-feet per year</i> ¹ Water volumes presented here should be accounted for in Table 16. ² Indicate whether project is likely to happen and what constraints, if any, exist for project implementation. ³ Provide estimated supply benefits, if available.								

Figure 61 - TABLE 26 Future water supply projects

Although the City does not have any future water supply projects planned to increase the amount of the water supply available, the City of Imperial is a participant in the Imperial Water Forum. The Imperial IRWMP being developed by the Water Forum includes evaluation of potential future projects and programs that may be implemented to increase the amount of the water supply available in all types of years. The Imperial IRWMP will contain an implementation plan and listing of projects to be implemented to increase the water supply portfolio. As a participant in the IRWMP, the City is working within the larger Region through the collaborative IRWM effort to increase the amount of supply within the Region.

Section 5 – Water Supply Reliability and Water Shortage Contingency Planning

Water Supply Reliability

An urban water supplier shall describe in the plan water management tools and options used by that entity that will maximize resources and minimize the need to import water from other regions (10620(f)).

For any water source that may not be available at a consistent level of use, given specific legal, environmental, water quality, or climatic factors, describe plans to supplement or replace that source with alternative sources or water demand management measures, to the extent practicable (10631(c)(2)).

The main factors that can cause water supply shortages for the City are water pollution, earthquakes and long term energy outages at the treatment and pumping facilities.

The Imperial Irrigation District is the only supplier of water to the City, and there is no alternative source water. The water quality of the agricultural drains, New River and Alamo River are high in total dissolved solids and other contaminants and are as such unusable as a potable or irrigation water source.

The City receives water from the All-American and Central Main Canals. If either the All-American Canal or Central Main Canal were shut down, water could not be delivered to the treatment plant. The shut down could be for scheduled maintenance or as a result of an emergency, such as an earthquake. In October 1979, an earthquake caused levee and slope failures along the All-American Canal east of El Centro, severely limiting water flow. This is the only time during the last 25 years that the All-American Canal was shut down.

Maintenance is scheduled to be performed monthly on the South Date Canal and Dahlia Lateral. Typically, however, the South Date Canal and the Dahlia Lateral are shut down about three times annually, usually lasting approximately three days each time. The Central Main Canal and the All-American Canal are seldom shut down. To perform maintenance on the Central Main Canal, the water level is lowered but service is not completely interrupted. According to plant operators, this is done every five to ten years.

In the event that there is a water shortage in the Lower Colorado River Basin, the

Imperial Irrigation District/San Diego County Water Authority water transfer agreement states that both agencies will share, on a pro-rata basis, any reductions in water to Imperial Irrigation District should a shortage declaration by the Secretary of the Interior for the Lower Colorado River Basin affect the Imperial Irrigation District's water conservation and transfer programs. When the amount of water in usable storage in Lake Mead is less than 15 million acre-feet and the unregulated inflow into Lake Powell is forecasted to be less than 8.8 million acre-feet, the Imperial Irrigation District and the San Diego County Water Authority have agreed to meet and confer to discuss a supplemental water transfer agreement in anticipation of the shortage.

Should operating conditions on the Colorado River indicate Imperial Irrigation District may be impacted by reductions in water deliveries, the Imperial Irrigation District will notify all of its water users by mail and will conduct an educational outreach program in conjunction with the local media and municipal water systems. The notice will request all water suppliers, and in particular residential, industrial, and commercial water users, to conserve water on a voluntary basis. Urban water suppliers will be responsible for notifying their customers and implementing their own voluntary water conservation measures and programs.

Urban water supply reductions in the Imperial Unit are not likely to occur during the next twenty years. Urban water supply shortage stage one is voluntary, has cut back conditions of less than 15 percent, and is estimated to provide up to 79 percent of the reduction goal for urban water suppliers. Urban water supply shortage stage two is voluntary, has cut back conditions of 15 percent to less than 25 percent, and is estimated to provide 7 to 12 percent of the reduction goal for urban water suppliers. Urban water supply shortage stage 3 is mandatory, has cut back conditions of 25 percent to less than 35 percent, and is estimated to provide the remainder of any reduction goals for urban water suppliers.

Table 29 Factors resulting in inconsistency of supply

There are no known upcoming factors that will result in inconsistency of supply.

Imperial Irrigation District Supply

It is unlikely that the urban water supply of Imperial Irrigation District would ever be affected, even under shortage or drought conditions on the Colorado River. Urban water use in the Imperial Unit makes up less than three percent of the total water delivered by the Imperial Irrigation District. Under a worst case water supply scenario, the Imperial Irrigation District could meet the demands of urban water users. Due to the high priority of the Imperial Irrigation District's water rights, Colorado River flows, and the storage facilities on the Colorado River it is highly unlikely that Imperial Irrigation District's water supply will be affected, even in dry years.

Water Shortage Contingency Planning

Actions to be undertaken by the urban water supplier to prepare for, and implement during, a catastrophic interruption of water supplies including, but not limited to, a regional power outage, an earthquake, or other disaster (10632(c)).

Upon a catastrophic water supply reduction, mandatory provisions to reduce individual urban consumer water use will be placed into effect. During a shortage the City would increase media attention to the water supply situation and would step up public water education programs, encourage property owners to apply for landscape and interior water use surveys and continue to advertise the importance of customers installing efficient plumbing fixtures.

During declared shortages, or when a shortage declaration appears imminent, the City Manager activates a City water shortage response team. The team includes: water, fire, planning, health, emergency services, public affairs, parks and recreation, and the Mayor's Office. During a declared water shortage, the City will accept applications for new building permits but will not issue permits until the shortage declaration is rescinded. An appeal process is available and ends at the City Council.

In the event of extended regional power outages, the City will use standby diesel generators that will power critical functions at the water treatment plant. The fuel would be brought in every two days. In this way the residents of El Centro would not lose supply of potable water.

In the event of an earthquake that damages critical components of the water treatment plant, the City will divert irrigation water into the potable water distribution system. Under this scenario non-potable water would be delivered to City customers and the water would have to be boiled by each customer prior to potable water use. The water could be delivered by diesel powered pumps to the City's distribution system. If the All-American or Central Main Canal is damaged and unable to transmit water, the City will declare a water shortage emergency and will implement the appropriate conservation measures. The City will have approximately ten days of raw water storage to rely on from the time of the emergency with these conservation measures in place.

Imperial Irrigation District Emergency Preparedness Plan

During or immediately after any water supply emergency, IID staff implements the Emergency Preparedness Plan. The Emergency Preparedness Plan includes required actions and procedures by IID staff to respond to events that impair water operation of canals, laterals, drains, dams, and other facilities. These responses are not normal operation and maintenance activities. Generally, any occurrence that requires an immediate response is classified as an extreme event or emergency.

The Emergency Preparedness Plan defines the role each responsible employee will play during an emergency. Water Department staff conducts emergency and/or disaster response planning in the Water Control Center. Coordination of staffs with other departments will take place in the General Manager's conference room. All-

American Canal River Division staff planning will be centered in the Imperial Dam Control House. Other staffs meet and coordinate actions at designated areas.

Established actions and procedures exist for extreme events and emergencies that endanger operation of the water system. Possible emergencies/extreme events that endanger operation of the water system could include: earthquakes, storms, rain, run-off from desert washes, flooding, facility or structure damage, power outages, fire, vehicles in canals, equipment theft/vandalism, or other disaster. The Imperial Irrigation District's water delivery and drainage systems do not totally shut down during an emergency.

The Imperial Irrigation District has conducted Emergency Preparedness Exercises in the past. Emergency preparedness exercises will be updated with the development of new emergency preparedness exercises. Water Department staffs trained and participated with the U. S. Department of the Interior Bureau of Reclamation's Tabletop Exercise for emergency preparedness.

The cities in the Imperial Unit have a ten-day storage holding capacity requirement. The Imperial County Office of Emergency Services requires this storage holding capacity for cities (Imperial Irrigation District, 1998, p.22).

IID is considered a special district in the eyes of the state and the federal government. A special district has to meet the same requirements as a local city pertaining to emergency preparedness and emergency management. As such, IID is required to go through the appropriate channels regarding mutual aid.

In the event of a natural and or man-made disaster, IID would open its Emergency Operations Center located at headquarters in Imperial, California. IID would then notify the Operational Area, which is the Imperial County Office of Emergency Services located in Heber at the Imperial County Fire Department Station # 2. If the event called for mutual aid IID, the EOC would request assistance from the OA. If the OA was unable to fulfill this request it would go to the next highest level, which would be the Regional Emergency Operations Center, located in Los Alamitos.

In the event the REOC was unable to fill the request it would go to the State Operations Center located in Sacramento. The SOC would fill the request or ask for federal assistance from the Federal Emergency Management Agency a subsection of the Federal Department of Homeland Security.

Additional, mandatory prohibitions against specific water use practices during water shortages, including, but not limited to, prohibiting the use of potable water for street cleaning (10632(d)).

The City has adopted the resolution found in Appendix C, Restrictions During a Declared Water-Shortage Emergency. The following restrictions shall be effective during a declared Water-Shortage Emergency:

1. There shall be no water used for irrigation or landscaping purposes.
2. There shall be no private or commercial car washing.
3. No restaurant, hotel, cafe, cafeteria or other public place where food is sold, served or offered for sale, shall serve drinking water to any customer unless requested.
4. Use of potable water for construction, compaction, dust control, street or parking lot sweeping, building wash down shall be prohibited.
5. Use of potable water for sewer system maintenance or fire protection training shall be prohibited without prior approval by the Mayor;
6. Use of potable water for any purpose in excess of the amount allocated shall be prohibited.
7. Other restrictions and prohibitions may become necessary during a declared Water Shortage Emergency, to safeguard the adequacy of the water supply for domestic, sanitation, fire protection, and environmental requirements.

Table 36 Water shortage contingency — mandatory prohibitions	
Prohibitions	Stage When Prohibition Becomes Mandatory
Using potable water for street washing	III
Serving drinking water unless requested	I
Use of potable water for construction, compaction, dust control and building wash down	II
Use of potable water for sewer system maintenance or fire protection training	III
Use of potable water in excess of amount allocated	IV
Other as necessary	IV

Figure 63 - TABLE 36 Water shortage contingency - mandatory prohibitions

Consumption reduction methods in the most restrictive stages. Each urban water supplier may use any type of consumption reduction methods in its water shortage contingency analysis that would reduce water use, are appropriate for its area, and have the ability to achieve a water use reduction consistent with up to a 50 percent reduction in water supply (10632(e)).

Water Shortage Stages and Triggering Mechanisms

As the water purveyor, the City of El Centro must provide the minimum health and safety water needs of the community at all times. The water shortage response is designed to provide a minimum of 50% of normal supply during a severe or extended water shortage. The rationing program triggering levels shown below were established to ensure that this goal is met.

Rationing stages may be triggered by groundwater contamination, power failure, earthquake or other natural disaster.

The City's only potable water source is the Colorado River. Specific criteria for triggering the City's rationing stages are shown in Figure 63.

Water Shortage Stages and Triggering Mechanisms				
Percent Reduction of Supply	Stage I Up to 15%	Stage II 15 - 25%	Stage III 25 - 35%	Stage IV 35 - 50% >
Water Supply Condition				
Supply	Projected supply insufficient to provide 80% of normal demand, Or	Projected supply insufficient to provide 75% of normal demand, Or	Projected supply insufficient to provide 65% of normal demand, Or	Projected supply insufficient to provide 50% of normal demand, Or
Water Quality	Contamination of 10% of water supply (exceeds primary drinking water standards)	Contamination of 20% of water supply (exceeds primary drinking water standards)	Contamination of 30% of water supply (exceeds primary drinking water standards)	Contamination of 40% of water supply (exceeds primary drinking water standards)

Figure 64 – Water shortage stages and triggering mechanisms

Water Allotment Methods

The City has established the following allocation method for each customer type. See the city ordinance for sample water shortage rationing allocation method.

Single Family Hybrid of Per-capita and Percentage Reduction

Multifamily Hybrid of Per-capita and Percentage Reduction

Commercial Percentage Reduction

Industrial Percentage Reduction

Gov't/Institutional Percentage Reduction

Recreational Percentage Reduction - vary by efficiency

Water Shortage Rationing Allocation Method

Single-family account allocations may be determined as follows: assuming 4 persons or less per home, an account would receive 11 HCF per month (68 gpcd) plus 55% of their historic use, not to exceed an upper limit. The upper limit on additional water may be 30 HCF per year (i.e., $132 \text{ HCF} + 50\% \text{ historic} \leq 162 \text{ HCF a year}$). Appeals would be available for additional people. For each additional person at a home the allotment is increased by 4 HCF per billing period (49 gcd).

Multi-residential account allocations may be determined as follows: assuming 3 persons or less per unit, accounts receive 6 HCF per unit per month (49 gcd), plus 40% of their historic use, not to exceed an upper limit. The upper limit on additional water may be 10 HCF per year per unit (i.e., $72 \text{ HCF} + 40\% \text{ historic} \leq 82 \text{ HCF a year}$). Appeals would be available for additional people. For each additional person, the allotment increases by 4 HCF per billing period (49 gcd).

Increased allocations for residential accounts would be limited to the following:

Greater number of residents than assumed by plan.

Medical conditions requiring additional water.

Commercial, Industrial and Institutional would receive a percentage reduction from historical use. The historical use period used to determine the baseline amount may vary based on specific factors. Appeals would be available for increased business, census or other factors.

New Customers Per-capita (no allocation for new landscaping during a water shortage.)

Based on current and projected customer demand, the city ordinance shown in Appendix C indicates the water allocated to each customer type by priority and rationing stage during a declared water shortage.

Individual customer allotments are based on a five-year period. This gives the City a more accurate view of the usual water needs of each customer and provides additional flexibility in determining allotments and reviewing appeals. However, no allotment may be greater than the amount used in the most recent year of the five-year base period.

The Water Department Manager shall classify each customer and calculate each customer's allotment according to the Sample Water Rationing Allocation Method. The allotment shall reflect seasonal patterns. Each customer shall be notified of their classification and allotment by mail before the effective date of the Water Shortage Emergency. New customers will be notified at the time the application for service is made. In a disaster, prior notice of allotment may not be possible; notice will be provided by other means. Any customer may appeal the Water Department Manager's classification on the basis of use or the allotment on the basis of incorrect calculation.

Rationing Stages and Reduction Goals

The City has developed a four stage rationing plan to invoke during declared water shortages. The rationing plan includes voluntary and mandatory rationing, depending on the causes, severity, and anticipated duration of the water supply shortage.

Water Rationing Stages and Reduction Goals			
Shortage Condition	Stage	Reduction Goal	Type of Rationing Program
Up to 15%	I	15%	Voluntary
15 – 25%	II	25%	Mandatory
25 - 35%	III	35%	Mandatory
35 - 50%	IV	50% or >	Mandatory

Figure 65 - Water rationing stages and reduction goals

Mandatory Prohibitions on Water Use

The El Centro "No Waste" Ordinance prohibits certain types of water uses during water shortage emergencies. The following are the stages at which water use prohibitions become active:

Table 37 Water shortage contingency — consumption reduction methods		
Consumption Reduction Methods	Stage When Method Takes Effect	Projected Reduction (%)
Education Program	All Stages	Yes
Demand Reduction Program	All stages	Yes
Voluntary Plumbing Fixture Replacement	All stages	Yes
Use Prohibitions	All stages	Yes
Water Shortage Pricing	All stages	Yes
Voluntary Rationing	I	No
Restrict Building Permits	II, III, IV	No
Mandatory Rationing	II, III, IV	No
Percentage Reduction by Customer Type	II, III, IV	No
Per Capita Allotment by Customer Type	IV	No
Flow Restriction for Wasters	IV	No

Figure 66 - TABLE 37 Water shortage contingency - consumption reduction methods

Priority by Use

Priorities for use of available potable water during shortages were based on input from the City Emergency Response Team, citizen groups, and legal requirements set forth in the California Water Code, Sections 350-358. Water allocations are established for all customers according to the following ranking system:

- Minimum health and safety allocations for interior residential needs (includes single family, multi-family, hospitals and convalescent facilities, retirement and mobile home communities, and student housing, and fire fighting and public safety)
- Commercial, industrial, institutional/governmental operations (where water is used for manufacturing and for minimum health and safety allocations for employees and visitors), to maintain jobs and economic base of the community (not for landscape uses)
- Existing landscaping
- New customers, proposed projects without permits when shortage declared.

Health and Safety Requirements

Based on commonly accepted estimates of interior residential water use in the United States, Figure 66 indicates per capita health and safety water requirements. In Stage I

shortages, customers may adjust either interior or outdoor water use (or both), in order to meet the voluntary water reduction goal.

However, under Stage II, Stage III and Stage IV mandatory rationing programs, the City has established a health and safety allotment of 50 gpcd (which translates to 24 HCF per person per year), because that amount of water is sufficient for essential interior water with no habit or plumbing fixture changes. If customers wish to change water use habits or plumbing fixtures, 50 gpcd is sufficient to provide for limited non-essential (i.e. outdoor) uses.

Stage IV mandatory rationing, which is likely to be declared only as the result of a prolonged water shortage or as a result of a disaster, would require that customers make changes in their interior water use habits (for instance, not flushing toilets unless “necessary” or taking less frequent showers).

Per Capita Health and Safety Water Quantity Calculations						
	Non-Conserving		Habit Changes ¹		Conserving Fixtures ²	
Toilets	4 flushes x 3.5 gpf	14	3 flush x 3.5 gpf	10.5	4 flush x 1.6 gpf	6.4
Shower	5 min x 3.0 gpm	15	4 min x 3.0 gpm	12	5 min x 2.0	10
Washer	12.0 gpcd	12	11.0 gpcd	11	10.0 gpcd	10
Kitchen	4 gpcd	4	4 gpcd	3	4 gpcd	3
other	4 gpcd	4	4 gpcd	4	4 gpcd	4
Gallons per person per day		49		40.5		33.4
CCF per person per year		24		20		16
1 Reduced shower use results from shorter length of shower and reduced flow. Reduced washer use results from fuller loads.						
2 Fixtures include ULF 1.6 gpf toilets, 2.0 gpm showerheads, faucet aerators and efficient clothes washers.						

Figure 67 - Per Capita Health and Safety water quantity calculations

An analysis of the impacts of each of the actions and conditions described in subdivisions (a) to (f), inclusive, on the revenues and expenditures of the urban water supplier, and proposed measures to overcome those impacts, such as the development of reserves and rate adjustments (10632(g)).

Mechanism to Determine Reductions in Water Use

Under normal water supply conditions, potable water production figures are recorded daily. Totals are reported weekly to the Water Treatment Facility Supervisor. Totals are reported monthly to the Water Department Manager and incorporated into the water supply report.

During a Stage I or Stage II water shortage, daily production figures are reported to the Supervisor. The Supervisor compares the weekly production to the target weekly production to verify that the reduction goal is being met. Weekly reports are forwarded to the Water Department Manager and the Water Shortage Response Team. Monthly reports are sent to the City Council. If reduction goals are not met, the Manager will notify the City Council so that corrective action can be taken.

During a Stage III or Stage IV water shortage, the procedure listed above will be followed, with the addition of a daily production report to the Manager. During emergency shortages, production figures are reported to the Supervisor hourly and to the Manager and the Water Shortage Response Team daily. Daily reports will also be provided to the City Council and the Imperial County Office of Emergency Services.

All surplus revenues that the City collects are currently used to fund the Rate Stabilization Fund, conservation, recycling, and other capital improvements. The City estimated projected ranges of water sales by shortage stage to best understand the impact each level of shortage will have on projected revenues and expenditures by each shortage stage.

Penalties or charges for excessive use, where applicable (10632(f)).

Any customer violating the regulations and restrictions on water use set forth in the "No Waste" Ordinance shall receive a written warning for the first such violation. Upon a second violation, the customer shall receive a written warning and the City may cause a flow-restrictor to be installed in the service. If a flow-restrictor is placed, the violator shall pay the cost of the installation and removal. Any willful violation occurring subsequent to the issuance of the second written warning shall constitute a misdemeanor and may be referred to the Office of the City Attorney for prosecution. If water service is disconnected, it shall be restored only upon payment of the turn-on charge fixed by the City Council.

There shall be rate increases starting with a 25% rate increase at Stage II; 50% at Stage III, and a 100% increase at Stage IV. See Appendix D, *Establishment of Rate Increases During a Water Shortage* for more information.

Table 38 Water shortage contingency — penalties and charges	
Penalties or Charges	Stage When Penalty Takes Effect
25% Rate Increase	II
50% Rate Increase	III
100% Rate Increase	IV
Penalty for Excess Use	II
200% Charge for Excess Use	III

Figure 68 - TABLE 38 Water shortage contingency - penalties and charges

A draft water shortage contingency resolution or ordinance (10632(h)).

A draft water shortage contingency resolution follows. This will be adopted at the public hearing for the UWMP.

Draft Resolution to Declare a Water Shortage Emergency

CITY OF EL CENTRO

IMPERIAL COUNTY,

CALIFORNIA Date

The City Council of El Centro does hereby resolve as follows:

PURSUANT to California Water Code Section 350 et seq., the Council has conducted duly noticed public hearings to establish the criteria under which a water shortage emergency may be declared.

WHEREAS, the Council finds, determines and declares as follows:

- (a) The City is the water purveyor for the property owners and inhabitants of El Centro;
- (b) The demand for water service is not expected to lessen.
- (c) When the potable water supply available to the City falls at or below the Stage II triggering levels described in the most current Urban Water Management Plan, the City will declare a water shortage emergency. The water supply would not be adequate to meet the ordinary demands and requirements of water consumers and there may be insufficient water for human consumption, sanitation, fire protection, and environmental requirements. This condition is likely to exist until groundwater contamination is remedied and/or water system damage resulting from a disaster is repaired and normal water service is restored.

NOW, THEREFORE, BE IT RESOLVED that the City Council of El Centro hereby directs the Mayor to find, determine, declare and conclude that a water shortage emergency condition exists that threatens the adequacy of water supply, until the City's water supply is deemed adequate and potable. After the declaration of a water shortage emergency, the Mayor is directed to determine the appropriate Rationing Stage and implement the City's Water Shortage Emergency Response.

FURTHERMORE, the Council shall periodically conduct proceedings to determine additional restrictions and regulations which may be necessary to safeguard the adequacy and quality of the water supply for domestic, sanitation, fire protection, and environmental requirements.

Moratorium on New Connections during a Water Shortage

CITY OF EL CENTRO

IMPERIAL COUNTY,

CALIFORNIA Date

The City Council of El Centro does hereby resolve as follows:

The Municipal Code of the City of El Centro is hereby amended to read as follows:

XX-5 MORATORIUM ON SERVICE COMMITMENTS AND CONNECTIONS

1. When the City declares a water shortage emergency, the following regulations shall become effective immediately and shall continue in full force and effect to prohibit the following while it remains in full force and effect:
 - a. The City shall not issue oral or written commitments to provide new or expanded water service, including will-serve letters.
 - b. The City shall not sell meters for water service connections, despite the prior issuance of will-serve letters or other oral or written service commitments, unless building permits have been issued.
 - c. The City shall not provide new or expanded water service connections, despite the prior issuance of will-serve letters or other oral or written service commitments and meters, unless building permits have been issued.
 - d. The City shall not provide water for use on any new plantings installed after the declaration of a Water Shortage Emergency.
 - e. The City shall not annex territory located outside the City's service boundary.
2. The following uses are exempt from the moratorium and upon application to the City shall receive necessary water service commitments and connections to receive water from the City:
 - a. Uses, including but not limited to, commercial, industrial, single and multifamily residential, for which a building permit has been issued by the City on or before the declaration of a Water Shortage Emergency.
 - b. Uses, including but not limited to, commercial, industrial, single and multifamily residential, for which a retail meter had been purchased from the City before the declaration of a Water Shortage Emergency, as evidenced by a written receipt and for which a building permit has been issued and remains in full force and effect.
 - c. Publicly owned and operated facilities, including but not limited to schools, fire stations, police stations, and hospitals and other facilities as necessary to protect the public health, safety and welfare.

Water Quality

The plan shall include information, to the extent practicable, relating to the quality of existing sources of water available to the supplier over the same five-year increments as described in subdivision (a) of Section 10631, and the manner in which water quality affects water management strategies and supply reliability (10634).

The Safe Drinking Water Act (“SDWA”) was amended on August 6, 1998 to include “systems providing water for human consumption that deliver water by constructed conveyances such as irrigation canals.” On October 27, 1998 the IID signed a Compliance Agreement with the California Department of Public Health (“CDPH”) requiring that all domestic users with service pipes to the IID’s canal system must receive an alternate supply of water for drinking and cooking. The alternate supply must be of sufficient quality to achieve an equivalent level of public health protection as provided by the SDWA. On May 19, 2000, CDPH provided written notice that the IID had met the requirements of the Compliance Agreement and that the IID faced no further enforcement actions. The IID continues to meet the conditions of the Compliance Agreement.

To comply with US Environmental Protection Agency (EPA) requirements and avoid termination of canal water service, residents in the IID service area who do not receive treated water service must obtain alternative water service for drinking and cooking from a state-approved provider. To avoid penalties that could exceed \$25,000 a day, IID strictly enforces this rule. The section tracks nearly 4,000 raw water service accounts required by the California Department of Public Health (CDPH) to have alternate drinking water service. The section maintains a small-acreage pipe and drinking water database, and provides an annual compliance update to CDPH.

Table 30 Water quality — current and projected water supply impacts						
Water source	Description of condition	2010	2015	2020	2025	2030
Imperial Irrigation District Raw Water Supply	Water Pollution	0	0	0	0	0
Units (circle one): acre-feet per year						

Figure 69 - TABLE 30 Water quality - current and projected water supply impacts

It is not anticipated that there will be any major raw water quality disruptions. The following describe the water quality concerns that were discussed in the recent

Sanitary Survey completed in 2010:

Source Water General Minerals

The bicarbonate alkalinity of the Colorado River raw water ranges from 160 to 200 mg/L. The hardness ranged from 190 to 240 mg/L. TDS ranged from 720 mg/L to 840 mg/L. The following summarizes the monitoring results for alkalinity, hardness and total dissolved solids (TDS) for samples collected from the IID system since 2003.

Sample Location	Date	TDS (mg/L)	Bicarbonate Alkalinity (mg/L)	Hardness as CaCO₃ (mg/L)
Drop 1	10/15/04	770	190	350
Drop 1	10/14/05	800	190	360
Drop 1	10/27/06	830	200	380
Drop 1	10/26/07	820	200	350
Drop 1	10/24/08	820	190	360
East High Line	10/15/04	770	190	350

Westside Main	10/24/08	820	190	360

Figure 70 - Raw Colorado River Water General Tested Mineral Quality (In IID Delivery System)

Water Pollution

The City participated in the Sanitary Survey Update 2010. The sanitary survey update provides the most recent information on the potential contaminant sources of the raw water supply. The main concern identified in the Sanitary Survey is the variable Microbial Character of the raw water.

The source water was tested as required by Title 22 California code by the IID. The Results of the bacteria testing showed wide fluctuations in the total coliform, fecal coliform and E.coli. While some results can be attributed to a passing slug of contaminated water or the testing method, it appears that there is some correlation between the season and high concentrations of bacteria. See Figure 71 for a graph of the variable total coliforms.

The variable microbial character of the raw water is due in part to:

- a. Storm Water Runoff and First Flush Events;
- b. Imperial Irrigation District routine inspection and maintenance procedures;
- c. Spills into the IID canal system;
- d. Drowning deaths in the IID canal system and associated response plans;
- e. Failing Septic Systems along the Colorado River;
- f. Recreational Activity;
- g. Agricultural activity.

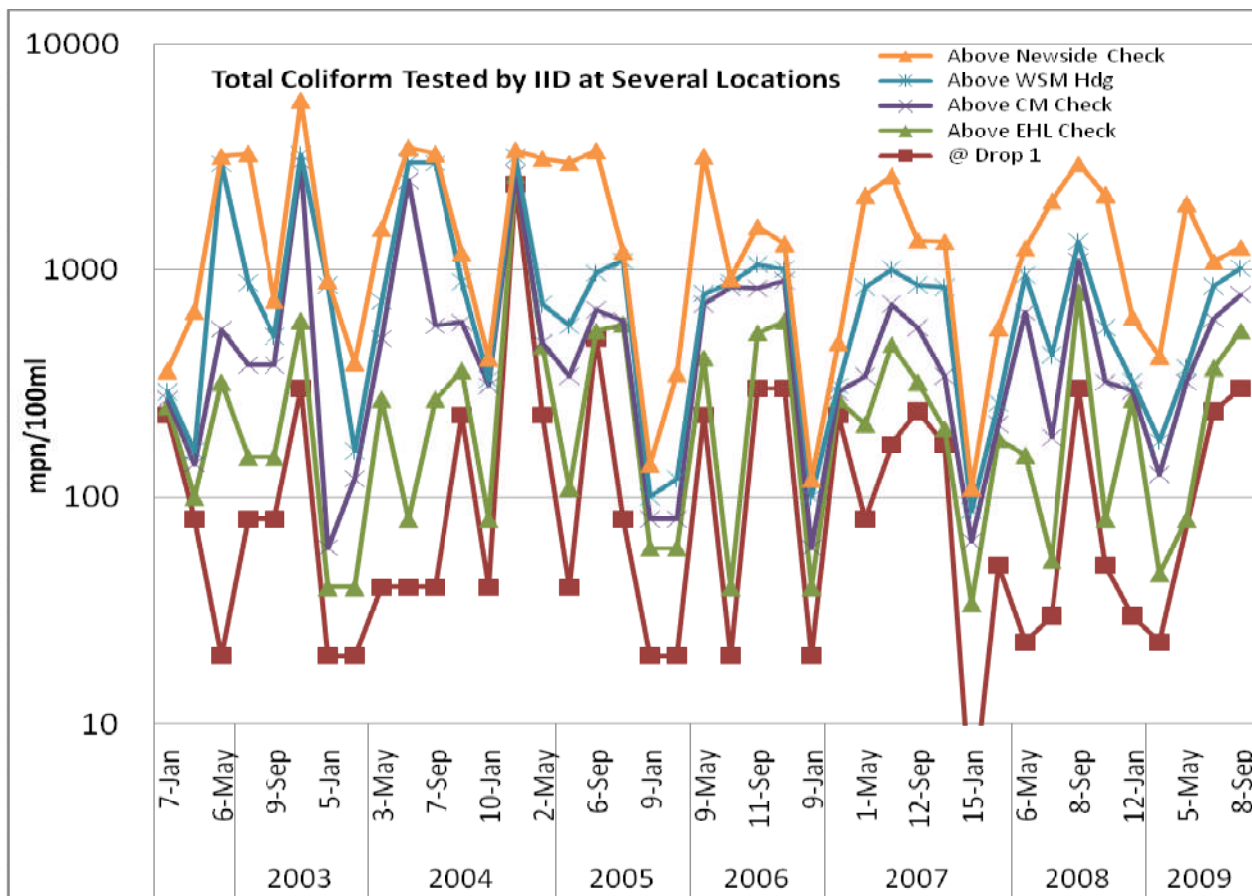

Figure 71 - Total Coliform Variations in the IID Canal Delivery System

According to the Sanitary Survey Update 2010, it appears that there is some correlation of high total coliform between the various locations. It also appears that the longer the water is in the IID canal system, the higher the Total Coliform counts. It appears that there is an additional coliform source or that the conditions support bacteria growth within the IID canal system.

Temperature is widely recognized as an important controlling factor in influencing bacterial growth. In climates where water temperatures are warm such as the Imperial Valley, bacterial growth may be very rapid. Most bacteria thrive at temperatures at or around that of the human body 98.6°F (37°C), and some, such as *Escherichia coli* (*E. coli*), are normal parts of the human intestinal flora. These organisms are mesophiles (moderate-temperature-loving), with an optimum growth temperature between 77°F (25°C) and 104°F (40°C).

The Sanitary Survey included recommendations for the City to reduce the impact of possible contaminants for the next five years. The City plans to implement the recommendations in the survey.

Drought Planning

Describe the reliability of the water supply and vulnerability to seasonal or climatic shortage, to the extent practicable, and provide data for each of the following: (A) an average water year, (B) a single dry water year, (C) multiple dry water years (10631(c)(1)).

Under the *Law of the River*, IID retains a legal right to annual net consumptive use of 3.1 MAF from the Colorado River. Under the terms of various agreements and laws, the annual Colorado River flows would have to be reduced to less than 5.0 MAF (one-third of historic average) before the water supply to IID would be impacted. Nevertheless, in the face of a large-scale water supply disruption in the western states, IID is potentially subject to some water supply reduction.

Even in drought years with Lower Colorado River flows less than 7.5 MAF, the existing laws and agreements provide security that the IID should receive its Present Perfected Rights of 2.6 MAF and its overall water allocation remains at 3.1 MAF. This protection is based on the following:

- 1885 California water right, based on reasonable and beneficial use of approximately 7 MAF, conveyed to IID on June 22, 1916.

- 1922 Colorado River Compact requires the Upper Basin states to ensure the supply of 7.5 MAF at Lees Ferry for use by the Lower Basin states (actually stated as 75 MAF over 10 years). Thus, it is the responsibility of the Upper Basin states to provide the full Lower Basin allocation; even in drought years and even if the 10-year running average annual water supply of the river is less than 15.0 MAF.
- 1931 Seven-Party Agreement provides a schedule of apportionments and priorities, which the parties requested “The Division of Water Resource to, in all respects, recognize... and recommend to the Secretary of the Interior... for insertion in any and all contracts for water made by him pursuant to the terms of the Boulder Canyon Project Act...Pursuant to the provisions . . . California was apportioned 4.4 million AF per year out of the lower basin allocation of 7.5 million AF per year, plus 50% of any available surplus water.”
- 1931 IID agreed to limit its California pre-1914 appropriate water rights in quantity and priority to the apportionments and priorities contained in the Seven-Party Agreement.
- 1968 Colorado River Basin Project Act states that all deliveries to the Central Arizona Project (CAP) and all other post-1968 water deliveries are subordinate to pre-existing Colorado River water rights in the Lower Basin, regardless of each state’s allocations under the 1928 Boulder Canyon Project Act. Therefore, all post-1968 rights in the Lower Basin, including the CAP’s, are effectively junior in priority to California’s Colorado River diversions under its 4.4 MAF rights. Post-1968 rights in the Lower Basin are estimated to be 1.8 MAF.
- 1979 Supplemental Decree in Arizona v. California retains IID’s present perfected rights to use of the Colorado River water. If water supply shortages occur along the Colorado River, IID’s present perfected rights must be satisfied prior to the satisfaction of any nonperfected rights, regardless of state lines and Federal agreements. IID has a present perfected right to 2.6 MAF.
- 2003 QSA/Transfer Agreements slightly modify the guaranteed senior water right of IID within California under the terms of the Seven Party Agreement (senior to CVWD, MWD and San Diego city and county), as follows: IID retains its priority 3(a) right to 3.1 MAF of net consumptive use (including transfers out of the IID service area) at Imperial Dam; however, if IID does

not use its full annual apportionment, then MWD can import the balance up to California's 4.4 MAF per year allocation.

- 2007 USBR interim guidelines provide that shortages in Lake Mead storage, and decreasing water levels in the reservoir, will prompt reductions in the deliveries to Arizona and Nevada, but that California deliveries will remain at 4.4 MAF. If California deliveries remain to be 4.4 MAF, then IID deliveries should likewise remain at the agreed right of 3.1 MAF net consumptive use under the terms of the QSA/Transfer Agreements.

Because IID's 2000 Regional UWMP was deemed obsolete and is no longer supported by IID due to the consumptive use limits agreed upon in the QSA, the water supplies available during a normal year are best represented by the post-QSA era (2003 and later). This represents the maximum amount of supply available and is thus the new normal water year. This is the age of limits for IID, where water is not necessarily tightly constrained or scarce, but rather the supply is no longer unlimited due to the agreements with other QSA participants.

Distribution and Priority of Deliveries within IID

See <http://www.iid.com/Water/EquitableDistribution> for more information.

For the single dry and multiple dry water years assessment, IID's Equitable Distribution Plan (EDP) governs. The EDP was adopted in 2007, along with subsequent regulations, allowing the IID Board to make an annual determination as to Supply/Demand Imbalance (SDI) conditions. On October 26, 2008, IID staff summarized the situation in a board presentation, by noting that a 64% probability existed of demand exceeding supply in the 2009 calendar year, even assuming no overrun were to occur in 2008. Similarly, the Hanemann Brookes Study opined that SDI situations were likely to occur "4 or 5 times out of the next 10 years", and from 2003 through 2008 IID was accounted as overrunning its annual water limit three times. The Equitable Distribution Plan and the Supply/Demand Imbalance are discussed in Item 4 under the single dry and multiple dry year projections.

Future apportionment of municipal, industrial, geothermal, feedlots/dairies, and environmental resources was prescribed in the EDP. The EDP prescribes the amount of water that IID water users receive during periods of supply/demand imbalance (SDI).

The Interim Water Supply Policy, approved on 09/29/09, describes the amount of water available for Non-Agricultural projects and describes the required fees.

Under SDI conditions, industrial and geothermal water users are placed into two categories: (1) For users with existing contracts (as of 2008), water allocated is based on past use, not-to-exceed contracted amount and contract terms; and (2) for contracts after 2008, water allocation is based on anticipated use. The contract terms include not-to-exceed amounts, and considerations for water availability. Future water allocation for dairies and feed lots is based on historical practices. Environmental resources use is based on the amount of mitigation area that has been developed.

IID has established an Equitable Distribution Plan and implementing regulations, together referred to as the Equitable Distribution Program, that are designed to provide for the distribution of water in any year when expected demand for water is likely to exceed expected supply. Under the Equitable Distribution Program, when a supply/demand imbalance is declared, IID apportions the estimated supply among the various types of water users as follows:

- a) Municipal and Commercial Users – Municipal and Commercial water users will receive the first allocation, the base amount of 2006 usage plus current District wide average use per capita multiplied by the increase in population since 2006.
- b) Industrial Users – For existing contracts, estimated based on past use, not to exceed contracted amount and contract terms. For new contracts, estimated based on anticipated use, not to exceed contract amount and contract terms, taking into consideration the Interim Water Supply Policy dated 09/29/09.
- c) Feedlots and Dairies – Estimated based upon past use and consideration of future changes;
- d) Environmental Resources Water – Estimated based upon the amount reasonably necessary to achieve the purposes of the District's commitments, taking past use into account; and
- e) Agricultural Lands – Straight Line Apportionment. Subtract the estimated demand for categories a through d above from Available Water Supply, and then divide the remaining supply by the total number of Eligible Agricultural Acres. The amount of water apportioned to acreage that does not comply with Eligible Agricultural Acres will be placed in the District Water Exchange.

As part of the Equitable Distribution Plan, a District Water Exchange is established so

that agricultural water users can sell and buy water. This provides flexibility for some agricultural water users to obtain water in addition to their straight line apportionment.

Consumptive use is not the same as delivery. Exhibit B of the Colorado River Water Delivery Agreement dated October 2003 (CRWDA), particularly column 13, summarizes the “IID Net Consumptive Use Amount”, which is indicative of future supplies as measured at Imperial Dam. Agricultural water demands will decrease in an amount equivalent to the water conservation attributable to on-farm efficiency measures (setting aside outside factors such as annual rainfall, differences attributable to the intensity of farming within IID such as acreage in production, double cropping, and market conditions, etc.) and IID system conservation and efficiency measures, so while IID’s total volume in this column is declining, so too are its agricultural demands. However, as a consequence of reducing the agricultural water demand through increased on-farm and system efficiency, less water is available for years when agricultural demand may be higher than normal, such as in years of low rainfall or due to cropping choices made by Imperial Valley growers. Such intermittent spikes in higher agricultural demand means less water is available for non-agricultural development.

Similarly, reductions attributable to system conservation efforts and the All-American Canal Lining Project are a result of the implementation of conservation measures, so there is no net decline in the water available for IID’s water users as a result of water conservation and transfer projects.

The variability in IID’s historical net consumptive use, which can be seen in Figure 73, is representative of the historic variability in agricultural deliveries, since IID’s MCI deliveries are relatively small and fairly consistent. Historic variations in agricultural water demand actually exceed, but are similar in magnitude, to the 408,000 AF per year of transfers called for in the QSA/Transfer Agreements. For example, agricultural water demands for 1970-2003 varied from a low of 2.555 MAF per year to a high of 3.172 MAF per year – a variation of 617,000 AF. The greatest variation for one year to the next was 326,000 AF, while several 2-year variations are in excess of 300,000 AF. Under the terms of the QSA/Transfer Agreements, IID has a variable demand and a fixed supply which can lead to the supply/ imbalances described above (overruns and under-runs); however, with implementation the Equitable Distribution Plan, these variations are expected to be much less.

Table 27 Basis of water year data	
Water Year Type	Base Year(s)
Average Water Year	1990
Single-Dry Water Year	1974
Multiple-Dry Water Years	1996-1998

Figure 72 - TABLE 27 Basis of water year data

“Average Water Year” means the average year of net consumptive use as compared to the consumptive use right.

“Single-Dry Water Year” in this plan signifies a year that the net consumptive use exceeded the consumptive use right.

“Multiple-Dry Water Years” in this plan signifies a stretch of three years that the net consumptive use exceeded the consumptive use right.

Figure 75 – IID Quantification and transfers as of 2008

Notes:

- Information conveyed in this figure is from the United State Bureau of Reclamation's Exhibit B of the Colorado River Water Delivery Agreement (CRWDA); however, IID has adjusted the 1988 MWD Transfer values for 2003 through 2006 to reflect actual values and the values for 2007 - 2077 to reflect the new IID/MWD agreement. IID Total

Reduction and IID Net Consumptive Use Amount have been recalculated to reflect these changes.

2. By IID and MWD agreement, the 1988 IID/MWD transfer has been fixed at 105 KAFY, starting in 2007.
3. Reductions include conservation for 1988 IID/MWD Agreement Transfer, IID/SDCWA Transfer, AAC Lining (amount may vary); SDCWA Transfer Mitigation, additional MWD Transfer w/Salton Sea Restoration (amount may vary), and Misc. PPRs and allow for Conditional Interim Surplus Agreement Backfill (amount may vary). Amounts in this table are independent of increases and reductions as allowed under the Inadvertent Overrun and Payback Policy. NOTE: Shaded columns represent amounts that might vary.
4. Assumes SDCWA does not elect termination in year 35.
5. Assumes SDCWA and IID mutually consent to renewal term of 30 years.

Source: QSA CRWDA Exhibit B

Stages of action to be undertaken by the urban water supplier in response to water supply shortages, including up to a 50 percent reduction in water supply, and an outline of specific water supply conditions which are applicable to each stage (10632(a)).

Table 35 Water shortage contingency — rationing stages to address water supply shortages		
Stage No.	Water Supply Conditions	% Shortage
I	Voluntary Rationing	15%
II	Rate Increases Start	25%
III	Mandatory Rationing	35%
IV	Per Capita Allotment per Customer Type	50%
¹ One of the stages of action must be designed to address a 50 percent reduction in water supply.		

Figure 76 - TABLE 35 Water shortage contingency - rationing stages to address water supply shortages

If the water supplies are reduced by 50 percent for a single year, the City will make an allotment on a per capita basis per connection and customer type.

An estimate of the minimum water supply available during each of the next three water years based on the driest three-year historic sequence for the agency's water supply (10632(b)).

Table 31 Supply reliability — current water sources				
Water supply sources¹	Average / Normal Water Year Supply²	Multiple Dry Water Year Supply²		
		Year 2011	Year 2012	Year 2013
Imperial Irrigation District	35,755	35,755	35,755	35,755
Percent of normal year:	100%			
<i>Units (circle one): acre-feet per year</i> ¹ From Table 16. ² See Table 27 for basis of water type years.				

Figure 77 - TABLE 31 Supply reliability - current water sources

The water supply available to the city is determined by the water treatment plant capacity and raw water influent piping, which is currently 35,755 acre-feet per year. Multiple dry water years do not affect the City's water supply.

A mechanism for determining actual reductions in water use pursuant to the urban water shortage contingency analysis 10632(i).

Under normal water supply conditions, potable water production figures are recorded daily. Totals are reported weekly to the Water Treatment Facility Supervisor. Totals are reported monthly to the Water Department Manager and incorporated into the water supply report.

During a Stage I or Stage II water shortage, daily production figures are reported to the Supervisor. The Supervisor compares the weekly production to the target weekly production to verify that the reduction goal is being met. Weekly reports are forwarded to the Water Department Manager and the Water Shortage Response Team. Monthly reports are sent to the City Council. If reduction goals are not met, the Manager will notify the City Council so that corrective action can be taken.

During a Stage III or Stage IV water shortage, the procedure listed above will be followed, with the addition of a daily production report to the Manager. During emergency shortages, production figures are reported to the Supervisor hourly and to the Manager and the Water Shortage Response Team daily. Daily reports will also be provided to the City Council and the Imperial County Office of Emergency Services.

All surplus revenues that the City collects are currently used to fund the Rate

Stabilization Fund, conservation, recycling, and other capital improvements. The City estimated projected ranges of water sales by shortage stage to best understand the impact each level of shortage will have on projected revenues and expenditures by each shortage stage.

Every urban water supplier shall include, as part of its urban water management plan, an assessment of the reliability of its water service to its customers during normal, dry, and multiple dry water years. This water supply and demand assessment shall compare the total water supply sources available to the water supplier with the total projected water use over the next 20 years, in five-year increments, for a normal water year, a single dry water year, and multiple dry water years. The water service reliability assessment shall be based upon the information compiled pursuant to Section 10631, including available data from state, regional, or local agency population projections within the service area of the urban water supplier (10635(a)).

There is no foreseeable water shortage in the City of El Centro for the next 20 years. The City of El Centro uses surface water supplied by the Colorado River that can supply the City with sufficient water to meet all projected demand. Thus the City is not affected by climatic related supply shortages. California experienced a prolonged drought from 1987 through 1992 and 2007 to 2009 and in 2010 below normal runoff. The Governor declared a statewide drought and proclaimed a state of emergency in nine counties on June 4, 2008 and a statewide emergency due to the drought on February 27, 2009. The droughts, however, did not affect the City's water supply.

Supply and Demand Comparison Provisions

The City's projected average use over the next 40 years is shown below. The projections are based on the Urban Water Targets as determined in this document.

Table 32				
Supply and demand comparison — normal year				
	2015	2020	2025	2030
Supply totals (from Table 16)	11,198	12,374	13,540	14,705
Demand totals (From Table 11)	11,198	12,374	13,540	14,705
Difference	0	0	0	0
Difference as % of Supply	0.0%	0.0%	0.0%	0.0%
Difference as % of Demand	0.0%	0.0%	0.0%	0.0%
<i>Units are in acre-feet per year.</i>				

Figure 78 - TABLE 32 Supply and demand comparison - normal year

Table 33 Supply and demand comparison — single dry year				
	2015	2020	2025	2030
Supply totals^{1,2}	11,198	12,374	13,540	14,705
Demand totals^{2,3,4}	11,198	12,374	13,540	14,705
Difference	0	0	0	0
Difference as % of Supply	0.0%	0.0%	0.0%	0.0%
Difference as % of Demand	0.0%	0.0%	0.0%	0.0%

Figure 79 - TABLE 33 Supply and demand comparison - single dry year

The total demand totals through 2030 were calculated using the urban water targets and population growth estimates. The total supply is limited by the amount of water that the water treatment plant can produce and the influent raw water pipeline. The City is able to produce 35,755 acre-feet of water per year. For purposes of preparing the Tables, the supply matches the forecasted demand.

The City forecasts no supply shortage at any point in the future. The Equitable Distribution Program will provide for the distribution of water in any year when expected demand for IID water is likely to exceed expected IID supply. Under the Equitable Distribution Program, when a supply/demand imbalance is declared, IID apportions the estimated supply among the various types of water users. Municipal and Commercial water users will receive the first allocation, the base amount of 2006 usage plus current District wide average use per capita multiplied by the increase in population since 2006.

Table 34 Supply and demand comparison — multiple dry-year events					
		2015	2020	2025	2030
Multiple-dry year first year supply	Supply totals ^{1,2}	11,198	12,374	13,540	14,705

	Difference as % of Demand	0.0%	0.0%	0.0%	0.0%
<i>Units are in acre-feet per year.</i> ¹ Consider the same sources as in Table 16. If new sources of water are planned, add a column to the table and specify the source, timing, and amount of water. ² Provide in the text of the UWMP text that discusses how single-dry-year water supply volumes were determined. ³ Consider the same demands as in Table 3. If new water demands are anticipated, add a column to the table and specify the source, timing, and amount of water. ⁴ The urban water target determined in this UWMP will be considered when developing the 2020 water demands included in this table.					

Figure 80 - TABLE 34 Supply and demand comparison - multiple dry-year events

Section 6 - Water Demand Management Measures

(Describe and provide a schedule of implementation for) each water demand management measure that is currently being implemented, or scheduled for implementation, including the steps necessary to implement any proposed measures, including, but not limited to, all of the following: (A) water survey programs for single-family residential and multifamily residential customers; (B) residential plumbing retrofit; (C) system water audits, leak detection, and repair; (D) metering with commodity rates for all new connections and retrofit of existing connections; (E) large landscape conservation programs and incentives; (F) high-efficiency washing machine rebate programs; (G) public information programs; (H) school education programs; (I) conservation programs for commercial, industrial, and institutional accounts; (J) wholesale agency programs; (K) conservation pricing; (L) water conservation coordinator; (M) water waste prohibition; (N) residential ultra-lowflush toilet replacement programs (10631(f)(1) and (2).

A description of the methods, if any, that the supplier will use to evaluate the effectiveness of water demand management measures implemented or described under the plan (10631(f)(3)).

An estimate, if available, of existing conservation savings on water use within the supplier's service area, and the effect of the savings on the supplier's ability to further reduce demand (10631(f)(4)).

An evaluation of each water demand management measure listed in paragraph (1) of subdivision (f) that is not currently being implemented or scheduled for implementation. In the course of the evaluation, first consideration shall be given to water demand management measures, or combination of measures, that offer lower incremental costs than expanded or additional water supplies. This evaluation shall do all of the following: (1) Take into account economic and noneconomic factors, including environmental, social, health, customer impact, and technological factors; (2) Include a cost-benefit analysis, identifying total benefits and total costs; (3) Include a description of funding available to implement any planned water supply project that would provide water at a higher unit cost; (4) Include a description of the water supplier's legal authority to implement the measure and efforts to work with other relevant agencies to ensure the implementation of the measure and to share the cost of implementation (10631(g)).

Figure 81 - Demand Management Measures and CUWCC BMP names

Implementation of the Water Conservation Bill of 2009 Requirements

The following are proposed policies and programs to help the City achieve the water use reductions per the Water Conservation Bill of 2009 requirements.

It is recommended that the City become a member of the California Urban Water Conservation Council (CUWCC). The following are current and new demand management measures (DMM):

6.1 *DMM 1 – Residential Surveys*

A Residential Assistance Checklist will be developed and started by the end of Fiscal Year 2012 to customers who report high water bills. It will include on-site interior and exterior detection, a landscape water survey, and a provision of low flow showerheads, aerators and information as appropriate. The City shall advise customers whenever it appears possible that leaks exist on the customer's side of the meter.

The City will provide site-specific leak detection assistance that may include, but is not limited to, the following: a water conservation survey, water efficiency suggestions, and/or inspection. The City will recommend showerheads and faucet-aerators that meet the current water efficiency standard as stipulated in the WaterSense Specifications (WSS) as needed.

The City will perform site-specific landscape water surveys that will include, but are not limited to, the following: check irrigation system and timers for maintenance and repairs needed; estimate or measure landscaped area; develop customer irrigation schedule based on precipitation rate, local climate, irrigation system performance, and landscape conditions; review the scheduling with customer; provide information packet to customer; and provide customer with evaluation results and water savings recommendations.

The City will provide reports, disaggregated by single-family and multi-family units, identifying: the number of residential assistance/leak detection survey visits completed; number of WSS showerheads distributed.

6.2 DMM 2 – Residential Plumbing Retrofit

California Civil Code Section 1101.4 and 1101.5 requires that after January 1, 2014, all noncompliant plumbing fixtures in any single-family, multi-family residential real property and any commercial residential real property be replaced with water-conserving plumbing fixtures when a permit is taken out for building additions, alterations. Also, State law requires that after January 1, 2017, noncompliant plumbing fixtures in any single-family residential property be replaced with water-conserving plumbing fixtures, and shall be verified at the time of sale or transfer.

The City's building department will verify that these codes are being enforced when a building permit is issued.

6.3 DMM 3 – System Water Audits, Leak Detection and Repair

The City will quantify the current volume of apparent and real water loss. The City will complete the standard water audit and balance using the AWWA Water Loss software to determine their current volume of apparent and real water loss and the cost impact of these losses on utility operations at no less than annual intervals.

The City may use up to four years to develop a validated data set for all entries of their water audit and balance. Data validation shall follow the methods suggested by the AWWA Software to improve the accuracy of the quantities for real and apparent losses.

The City will use the AWWA's 3rd Edition M36 Publication, *Water Audits and Loss Control Programs* (2009) for specific methods to reduce system losses.

The City will seek training in the AWWA water audit method and component analysis process (offered by CUWCC or AWWA) during the first four years of implementation, and complete a component analysis of real losses by the end of the fourth year, and update this analysis no less frequently than every four years.

The City will repair all reported leaks and breaks to the extent cost effective. By the end of the second year, The City shall establish and maintain a record-keeping system for the repair of reported leaks, including time of report, leak location, type of leaking pipe segment or fitting, and leak running time from report to repair. By the end of the fourth year, The City shall include estimated leakage

volume from report to repair, and cost of repair (including pavement restoration costs and paid-out damage claims, if any).

6.4 *DMM 4 – Metering with Commodity Rates for New Connections and Retrofit of Existing Customers*

A water meter is defined as a device that measures the actual volume of water delivered to an account in conformance with the guidelines of the American Water Works Association. Implementation shall consist of at least the following actions:

The City ordinances currently require meters for all service connections. Meters older than 10 years are inspected and replaced if necessary. The City reads the meters and bills customers based on volume of water used every month. The customers are billed based on the volume of water used, the size of the meter and the type of connection. The City keeps records of the historical usage, meter size and type of connection. There are no unmetered customers; there are some parks and public spaces that are unmetered.

The City will keep records of when each meter was installed, repaired, tested or replaced. The meter retrofits and volumetric rates are expected to result in a 20% reduction in demand for retrofitted accounts.

6.5 *DMM 5 – Large Landscape Conservation Programs and Incentives*

Water demand during the summer months is much higher than during the winter. Much of the summer demand placed on the City's water distribution system is for irrigation.

City Code Sect 29-142 requires water efficient landscaping, such as Xeriscape. The code states that landscaping located in commercial, industrial, and multifamily residential developments shall include a water efficient irrigation system in accordance with specifications provided by the department of public works. Prior to the issuance of a building permit, a landscape documentation package is submitted by the developer for review and approval that includes a water conservation concept statement, calculation of the maximum applied water and estimated water use, irrigation design plan and landscape irrigation audit schedule. The City will provide a statement designating those portions of the landscape to be used for such purposes and specifying water needed for the

water use budget, which may not exceed 100% of ETo on an annual basis. The City shall preserve water use records and budgets for customers with dedicated landscape irrigation accounts for at least four years.

- a) Number of dedicated irrigation meter accounts.
- b) Number of dedicated irrigation meter accounts with water budgets.
- c) Aggregate water use for dedicated non-recreational landscape accounts with budgets.
- d) Aggregate acreage assigned water budgets and average ET for dedicated non-recreational landscape accounts with budgets.
- e) Number of Accounts 20% over-budget.
- f) Number of accounts 20% over-budget offered technical assistance.
- g) Number of accounts 20% over-budget accepting technical assistance
- h) Aggregate acreage of recreational areas assigned water budgets and average ET for dedicated recreational landscape accounts with budgets.

The California Irrigation Management Information System (CIMIS) provides real time weather information to assist in irrigation scheduling. Although CIMIS was initially designed to help agricultural growers and turf managers administering parks, golf courses and other landscapes to develop water budgets for determining when to irrigate and how much water to apply, the user base has expanded over the years. In addition to those mentioned above, current CIMIS data users include local water agencies, fire fighters, air control board, pest control managers, university researchers, school teachers and students, construction engineers, consultants, hydrologists, state and federal agencies, utilities, lawyers, weather agencies, and many more.

There are a number of active CIMIS stations in the Imperial Valley, including in Seeley and Westmorland. These stations can provide evapotranspiration (ETo) information for the purpose of developing landscape water budgets and irrigation scheduling. It is estimated that this DMM will result in a 15%-20% reduction in demand for landscape irrigation.

6.6 DMM 6 – High Efficiency Washing Machine Rebate Program

A rebate program for incentives to purchase high-efficiency clothes washing machines (HECWs) is not cost effective at this time.

The City has 8,089 single-family residential water connections, and 295 multi-family connections. Assuming that there are four families per multi-family connection, there are $4 \times 295 + 8089 = 8,679$ equivalent dwelling units with washing machines. Assuming that 10% of the population already use HECWs, there are approximately 7,800 standard washing machines that can be upgraded. Assuming that 10% of the machines are replaced with HECWs and a \$100 rebate, the cost to the City will be $78 \times \$100$, or \$7,800. Assuming that the HECWs use an average of 15 gallons less water per load and there are 6 loads of wash per week per family, the benefit would be an overall saving of 365,000 gallons of water (1.1 Acre-Feet) per year. The cost to the participants was assumed to be \$1,000 per unit, with a \$100 rebate, or \$900. The average cost of a regular washer was assumed to be \$400, for a difference of \$500 cost to the consumer. The total costs to the consumers are therefore $\$500 \times 78 = \$39,000$. The overall savings in water fees would be $365,000/1000 \times \$3.17 = \$1,150$.

6.7 DMM 7 – Public Information Programs

The City will implement a public information program to promote water conservation and water conservation-related benefits. The program will include, when possible, but is not limited to, providing speakers to employees, community groups and the media; using paid and public service advertising; using bill inserts; providing information on customers' bills showing use for the last billing period compared to the same period the year before; providing public information to promote water conservation measures; and coordinating with other government agencies, industry groups, public interest groups, and the media. The program shall include, when possible, social marketing elements which are designed to change attitudes to influence behavior. This includes seeking input from the public to shape the water conservation message; training stakeholders outside the utility staff in water conservation priorities and techniques; and developing partnerships with stakeholders who carry the conservation message to their target markets.

6.8 DMM 8 – School Education Programs

The City will implement a school education program to promote water conservation and water conservation-related benefits. Programs will include working with school districts and private schools in the service area to provide instructional assistance, educational materials, and classroom presentations that identify urban, agricultural, and environmental issues and conditions in the local watershed. Educational materials shall meet the state education framework requirements and grade-appropriate materials shall be distributed. When mutually agreeable and beneficial, a lead regional agency will operate all or part of the education program. Implementation will commence on July 1, 2012.

The City shall maintain an active school education program to educate students in the agency's service area about water conservation and efficient water use.

The school information program shall consist of some of the following:

- 1) Curriculum materials developed and/or provided by the City (including confirmation that materials meet state education framework requirements and are grade-level appropriate).
- 2) Materials distributed to K-6 students. When possible, school education programs will reach grades 7-12 as well.
- 3) Description of materials used to meet minimum requirement.
- 4) Annual budget for school education program.
- 5) Description of all other water supplier education programs (Lists follow in Section

6.9 DMM 9 – Commercial, Industrial and Institutional Programs

Measures to achieve the water savings goal for Commercial, industrial, and institutional (CII) accounts for the City has been mainly focused on landscaping water savings, since landscaping irrigation makes up one of the highest demands during the summer; see DMM 5.

6.10 DMM 10 – Wholesale Assistance

The City will continue to work with the Imperial Irrigation District to participate in regional DMM efforts through the Integrated Regional Water Management Plan (IRWMP), informational groups and projects, and determination of the most cost-effective DMMs.

6.11 DMM 11 – Conservation Pricing

For conservation pricing, the City uses meters for each type of water connection, billed on a monthly basis. The City's goal is to recover the maximum amount of water sales revenue from volumetric rates that is consistent with utility costs, financial stability, revenue sufficiency, and customer equity. In addition to volumetric rate(s), conservation pricing also includes the following other charges:

- 1) Service connection charges designed to recover the separable costs of adding new customers to the water distribution system.
- 2) Monthly meter/service charges to recover costs unrelated to the volume of water delivered or new service connections and to ensure system revenue sufficiency.
- 3) Special rates and charges for temporary service, fire protection service, and other irregular services provided by the City.

The fixed service charge is small in comparison to the volumetric rate. The City's total annual revenue from the volumetric rate divided by the total annual revenue of volumetric rate plus the total annual revenue from the fixed service charge was 95% in 2010.

Let V stand for the total annual revenue from the volumetric rate(s) and M stand for total annual revenue from customer meter/service (fixed) charges, then:

$$\frac{V}{V + M} > 95\%$$

6.12 DMM 12 – Conservation Coordinator

The City will designate a person as the City's responsible conservation coordinator for program management, tracking, planning, and reporting on the DMM implementation. This may be a regional position.

6.13 DMM 13 – Water Waste Prohibition

The City enacted a No Waste Resolution prohibiting wasteful use of water is a part of the UWMP shown in **Appendix C**. The Resolution is titled "PROHIBITING WASTEFUL USE OF WATER REGULATIONS AND RESTRICTIONS ON WATER USE".

6.14 DMM 14 – Residential High Efficiency Toilet (HET) Replacement Programs

The City requires compliance with state regulations for water efficient devices in new construction, per the Uniform Building Code. Retailers in California are generally required to provide only high water efficiency toilets and appliances. Also, the State of California has enacted legislation to require retrofit for houses for sale or during rehabilitation.

Resolution to Adopt the Urban Water Management Plan

CITY OF EL CENTRO
IMPERIAL COUNTY, CALIFORNIA
June 21, 2011

The City Council of the City of El Centro does hereby resolve as follows:

WHEREAS the California Legislature enacted Assembly Bill 797 (Water Code Section 10610 et seq., known as the Urban Water Management Planning Act) during the 1983-1984 Regular Session, and as amended subsequently, which mandates that every supplier providing water for municipal purposes to more than 3,000 customers or supplying more than 3,000 acre-feet of water annually, prepare an Urban Water Management Plan, the primary objective of which is to plan for the conservation and efficient use of water; and

WHEREAS the City is an urban supplier of water providing water to a population over 17,000, and

WHEREAS the Plan shall be periodically reviewed at least once every five years, and that the City shall make any amendments or changes to its plan which are indicated by the review; and

WHEREAS the Plan must be adopted after public review and hearing, and filed with the California Department of Water Resources within thirty days of adoption; and

WHEREAS the City has therefore, prepared and circulated for public review a draft Urban Water Management Plan, and a properly noticed public hearing regarding said Plan was held by the City Council on June 21, 2011, and

WHEREAS the City of El Centro did prepare and shall file said Plan with the California Department of Water Resources by July 30, 2011;

NOW, THEREFORE, BE IT RESOLVED by the City Council of the City of El Centro as follows:

The 2010 Urban Water Management Plan is hereby adopted and ordered filed with the

City Clerk; The Mayor is hereby authorized and directed to file the 2010 Urban Water Management Plan with the California Department of Water Resources within 30 days after this date;

The Mayor is hereby authorized and directed to implement the Water Conservation Programs as set forth in the 2011 Urban Water Management Plan, which includes water shortage contingency analysis and recommendations to the City Council regarding necessary procedures, rules, and regulations to carry out effective and equitable water conservation programs;

In a water shortage, the Mayor is hereby authorized to declare a Water Shortage Emergency according to the Water Shortage Stages and Triggers indicated in the Plan, and implement necessary elements of the Plan;

The Mayor shall recommend to the City Council additional regulations to carry out effective and equitable allocation of water resources; and

The attached budget is approved and authorized for implementation.

ADOPTED this 21st day of June 2011, by the following vote:

AYES:

NOES:

ABSENT: ABSTAIN:

ATTEST:

City Clerk

City Council Members
(indicate names) Mayor

Director, Public Works
Department

Chief, Water Department

Approved as to Form and Legality:

City Attorney

APPENDIX C

No Waste Ordinance

CITY OF EL CENTRO
IMPERIAL COUNTY,
CALIFORNIA Date

The City Council of the City of El Centro does hereby resolve as follows:
The Municipal Code of the City of El Centro is hereby amended by adding
Section XX to Chapter XX, to read as follows:

XX-5 PROHIBITING WASTEFUL USE OF WATER REGULATIONS AND RESTRICTIONS ON WATER USE

It is hereby resolved by the City Council that in order to conserve the City's water supply for the greatest public benefit and to reduce the quantity of water used by the City's customers, that wasteful use of water should be eliminated. Customers of the City shall observe the following regulations and restrictions on water use:

1. No customer shall waste water. As used herein, the term "waste" means:
 - a. Use of potable water to irrigate turf, ground-cover, shrubbery, crops, vegetation, and trees between the hours of 10:00 o'clock A.M. and 6:00 o'clock P.M. or in such a manner as to result in runoff for more than five (5) minutes;
 - b. Use of potable water to wash sidewalks, walkways, driveways, parking lots, open ground or other hard surfaced areas except where necessary for public health or safety;
 - c. Allowing potable water to escape from breaks within the customer's plumbing system for more than twenty-four hours after the customer is notified or discovers the break;
 - d. Washing cars, boats, trailers, aircraft, or other vehicles by hose without a shutoff nozzle and bucket except to wash such vehicles at commercial or fleet vehicle washing facilities using water recycling equipment.
 - e. Use of potable water to clean, fill or maintain decorative fountains, lakes or ponds.

2. The following restrictions are effective during a declared Water-Shortage Emergency.
 - a. No restaurant, hotel, cafe, cafeteria or other public place where food is sold, served or offered for sale, shall serve drinking water to any customer unless requested.
 - b. Use of potable water for construction, compaction, dust control, street or parking lot sweeping, building wash down where non-potable water is sufficient.
 - c. Use of potable water for sewer system maintenance or fire protection training without prior approval by the Mayor;
 - d. Use of potable water for any purpose in excess of the amount allocated.
3. Other restrictions may be necessary during a declared Water Shortage Emergency, to safeguard the adequacy of the water supply for domestic, sanitation, fire protection, and environmental requirements.

Enforcement

Any customer violating the regulations and restrictions on water use set forth in this chapter shall receive a written warning for the first such violation. Upon a second violation, the customer shall receive a written warning and the district may cause a flow-restrictor to be installed in the service. If a flow-restrictor is placed, the cost of installation and removal shall be paid by the violator. Any willful violation occurring subsequent to the issuance of the second written warning shall constitute a misdemeanor and may be referred to the City Attorney's Office for prosecution. The City may also disconnect the water service. If water service is disconnected, it shall be restored only upon payment of the turn-on charge fixed by the City Council.

Penalty for violations

Except as provided in the enforcement section for the first and second violations any person, firm, partnership, association, corporation or political entity violating or causing or permitting the violation of any of the provisions of this section or providing false information to the City in response to City's requests for information needed by the City to calculate consumer water allotments shall be guilty of a misdemeanor punishable by imprisonment in the county jail for not more that thirty days or by a fine not exceeding one thousand dollars or both. Each separate day or portion thereof in which any violation occurs or continues without a good faith effort by the responsible party to correct the violation shall constitute a separate offense and, upon conviction thereof, shall be separately punishable.

Appeals

Variances from the requirements of this Section may be granted by the City Council only after denial of a variance request by the City Manager. Appeals of variance request denials shall be made in writing to the City Clerk at least 2 weeks prior to the meeting at which they will be heard. Upon granting any appeal, the City Council may impose any conditions it determines to be just and proper. Variances granted by the City Council shall be prepared in writing and furnished to the applicant.

Remedies/Cumulative

The remedies available to the City to enforce this ordinance are in addition to any other remedies available under the City's code or any state statutes or regulations, and do not replace or supplant any other remedy, but are cumulative.

Resolution to Declare a Water Shortage Emergency

CITY OF EL CENTRO
IMPERIAL COUNTY,
CALIFORNIA Date

The City Council of El Centro does hereby resolve as follows:

PURSUANT to California Water Code Section 350 et seq., the Council has conducted duly noticed public hearings to establish the criteria under which a water shortage emergency may be declared.

WHEREAS, the Council finds, determines and declares as follows:

- (a) The City is the water purveyor for the property owners and inhabitants of El Centro;
- (b) The demand for water service is not expected to lessen.
- (c) When the potable water supply available to the City falls at or below the Stage II triggering levels described in the 2010 Urban Water Management Plan, the City will declare a water shortage emergency. The water supply would not be adequate to meet the ordinary demands and requirements of water consumers and there may be insufficient water for human consumption, sanitation, fire protection, and environmental requirements. This condition is likely to exist until groundwater contamination is remedied and/or water system damage resulting from a disaster are repaired and normal water service is restored.

NOW, THEREFORE, BE IT RESOLVED that the City Council of El Centro hereby directs the Mayor to find, determine, declare and conclude that a water shortage emergency condition exists that threatens the adequacy of water supply, until the City's water supply is deemed adequate and potable. After the declaration of a water shortage emergency, the Mayor is directed to determine the appropriate Rationing Stage and implement the City's Water Shortage Emergency Response.

FURTHERMORE, the Council shall periodically conduct proceedings to determine additional restrictions and regulations which may be necessary to safeguard the adequacy and quality of the water supply for domestic, sanitation, fire protection, and environmental requirements.

Moratorium On New Connections During A Water Shortage

CITY OF EL CENTRO
IMPERIAL COUNTY,
CALIFORNIA Date

The City Council of El Centro does hereby resolve as follows:

The Municipal Code of the City of El Centro is hereby amended to read as follows:

XX-5 MORATORIUM ON SERVICE COMMITMENTS AND CONNECTIONS

- 1 When the City declares a water shortage emergency, the following regulations shall become effective immediately and shall continue in full force and effect to prohibit the following while it remains in full force and effect:
 - a. Irrigation for landscaping shall be prohibited.
 - b. The City shall not issue oral or written commitments to provide new or expanded water service, including will-serve letters.
 - c. The City shall not sell meters for water service connections, despite the prior issuance of will-serve letters or other oral or written service commitments, unless building permits have been issued.
 - d. The City shall not provide new or expanded water service connections, despite the prior issuance of will-serve letters or other oral or written service commitments and meters, unless building permits have been issued.
 - e. The City shall not provide water for use on any new plantings installed after the declaration of a Water Shortage Emergency.
 - f. The City shall not annex territory located outside the City's service boundary.
2. The following uses are exempt from the moratorium and upon application to the City shall receive necessary water service commitments and connections to receive water from the City:
 - a. Uses, including but not limited to, commercial, industrial, single and multifamily residential, for which a building permit has been issued by the City on or before the declaration of a Water Shortage Emergency.
 - b. Uses, including but not limited to, commercial, industrial, single and multifamily residential, for which a retail meter had been purchased from the City before the declaration of a Water Shortage Emergency, as evidenced by a written receipt and for which a building permit has been issued and remains in full force and

effect.

- d. Publicly owned and operated facilities, including but not limited to schools, fire stations, police stations, and hospitals and other facilities as necessary to protect the public health, safety and welfare.

Water Shortage Rationing Allocation Method

Single-family account allocations may be determined as follows: assuming 4 persons or less per home, an account would receive 11 HCF per month (68 gpcd) plus 55% of their historic use, not to exceed an upper limit. The upper limit on additional water may be 30 HCF per year (i.e., $132 \text{ HCF} + 50\% \text{ historic} \leq 162 \text{ HCF a year}$). Appeals would be available for additional people. For each additional person at a home the allotment is increased by 4 HCF per billing period (49 gcd).

Multi-residential account allocations may be determined as follows: assuming 3 persons or less per unit, accounts receive 6 HCF per unit per month (49 gcd), plus 40% of their historic use, not to exceed an upper limit. The upper limit on additional water may be 10 HCF per year per unit (i.e., $72 \text{ HCF} + 40\% \text{ historic} \leq 82 \text{ HCF a year}$). Appeals would be available for additional people. For each additional person, the allotment increases by 4 HCF per billing period (49 gcd).

Increased allocations for residential accounts would be limited to the following:

1. Greater number of residents than assumed by plan.
2. Medical conditions requiring additional water.

Commercial, Industrial and Institutional would receive a percentage reduction from historical use. The historical use period used to determine the baseline amount may vary based on specific factors. Appeals would be available for increased business, census or other factors.

APPENDIX D

Establishment of Rate Increases During a Water Shortage

In order to mitigate the financial impacts of a water shortage, the City has established an Emergency Fund. The goal is to maintain the fund at 75% of normal water department revenue. This fund will be used to stabilize rates during periods of water shortage or disasters affecting the water supply. The City will not have to increase rates as much or as often during a prolonged or severe shortage.

However, even with the emergency fund, rate increases will be necessary during a prolonged water shortage. As described in this Plan, a Stage II shortage will be accompanied by a 15- 25% reduction in water deliveries while a Stage III will be accompanied by a 25 -35% reduction. The experiences of California water purveyors during the 1990-91 water shortage demonstrated that actual water use reductions by customers are usually considerably larger than those requested by the supplier. During the 1990-91 water shortage it was also politically difficult for many agencies to adopt the rate increases necessitated by a 20% to 50% reduction in sales. When a Water Shortage Emergency is declared, the supply shortage will trigger the appropriate Rationing Stage and rate increase.

Water rates increase by the following percentages when the indicated Stages are implemented:

Stage I	no rate increase
Stage II	25% increase over pre-shortage rates
Stage III	50% increase over pre-shortage rates
Stage IV	100% increase over pre-shortage rates
End of the Water Shortage Emergency	

15% increase over pre-shortage rates (This rate increase should be re-evaluated every two years)

Most California water agencies, which experienced water shortages, found that customer demand did not return to pre-shortage levels. After a shortage, water department expenses are expected to drop below pre-shortage levels but water sales are not expected to rebound. In anticipation of reduced sales, after a declared shortage ends, the City's rates will be set for one year at 115% of the pre-shortage rates. Any excess revenues collected as a result of this rate adjustment will be used for the Rate Stabilization Fund.

APPENDIX F

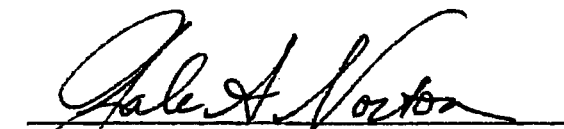

Colorado River Water Delivery Agreement: Federal Quantification Settlement Agreement (QSA)

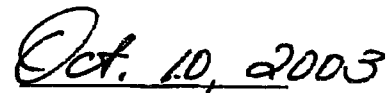

THE SECRETARY OF THE INTERIOR
WASHINGTON

Colorado River Water Delivery Agreement:
Federal Quantification Settlement Agreement
for purposes of Section 5(B) of
Interim Surplus Guidelines

Approved:

Gale A. Norton
Secretary of the Interior

Date

COLORADO RIVER WATER DELIVERY AGREEMENT

The United States by and through the Secretary of the Interior (Secretary) hereby enters into this Colorado River Water Delivery Agreement (Agreement) with the Imperial Irrigation District (IID), the Coachella Valley Water District (CVWD), The Metropolitan Water District of Southern California (MWD) (these three districts are collectively referred to herein as the Districts), and the San Diego County Water Authority (SDCWA). The Secretary, IID, CVWD, MWD and SDCWA hereby agree as follows:

RECITALS

- A. By regulations dated September 28, 1931, the Secretary incorporated the schedule of priorities provided in the Seven Party Agreement dated August 18, 1931, and established priorities One through Seven for use of the waters of the Colorado River within the State of California. The regulations were promulgated pursuant to the Boulder Canyon Project Act (BCPA) and required that contracts be entered into for the delivery of water within those priorities.
- B. The Secretary has entered into contracts with, among others, the Palo Verde Irrigation District (PVID), IID, CVWD, and MWD, for the delivery of Colorado River water pursuant to Section 5 of the BCPA (Section 5 Contracts). Under those Section 5 Contracts, PVID, IID, CVWD and MWD have certain rights to the delivery of Colorado River water, which for PVID and IID include the satisfaction of present perfected rights in accordance with Section 6 of the BCPA. MWD and CVWD also have surplus water delivery contracts with the Secretary.
- C. IID, CVWD, MWD and SDCWA have entered into agreements relating to, among other matters, their respective beneficial consumptive use of Colorado River water and desire that, for the term of this Agreement, Colorado River water be delivered by the Secretary in the manner contemplated in this Agreement.
- D. The Secretary has the authority to enter into this Agreement on behalf of the United States pursuant to the BCPA, the 1964 Decree in Arizona v. California, and other applicable authorities.

OPERATIVE TERMS

1. WATER DELIVERY CONTRACTS

- a. Priorities 1, 2, 3(b), 6(b), and 7 of current Section 5 Contracts for the delivery of Colorado River water in the State of California and Indian and miscellaneous Present Perfected Rights (PPRs) within the State of California and other existing surplus water contracts are not affected by this Agreement.

- b. The Secretary agrees to deliver Colorado River water in the manner set forth in this Agreement during the term of this Agreement. The Secretary shall cease delivering water pursuant to this Agreement at the end of the term of this Agreement; provided, however, that the Secretary's delivery commitment to the San Luis Rey Indian Water Rights Settlement Parties (SLR) shall not terminate at the end of the term but shall instead continue, pursuant to Section 106 of Public Law 100-675, 102 Stat. 4000 et seq., as amended, subject to the terms and conditions of any applicable agreement to which the Secretary is a party concerning the allocation of water to be conserved from the lining of the All-American and Coachella Canals.
- c. The Districts' respective Section 5 Contracts shall remain in full force and effect and, with this Agreement, shall govern the delivery of Colorado River water.

2. QUANTIFICATION OF PRIORITY 3(a)

- a. Except as otherwise determined under the Inadvertent Overrun and Payback Policy identified in Section 9 of this Agreement, the Secretary shall deliver Priority 3(a) Colorado River water to IID in an amount up to but not more than a consumptive use amount of 3.1 million acre-feet per year (AFY) less the amount of water equal to that to be delivered by the Secretary for the benefit of CVWD, MWD, SDCWA, SLR, and Indian and miscellaneous PPRs as set forth in Exhibits A and B hereto. Colorado River water acquired by IID after the date of this Agreement, and where necessary approved by the Secretary, shall not count against this cap.
- b. Except as otherwise determined under the Inadvertent Overrun and Payback Policy, the Secretary shall deliver Priority 3(a) Colorado River water to CVWD in an amount up to but not more than a consumptive use amount of 330,000 AFY less the amount of water equal to that to be delivered by the Secretary for the benefit of IID, MWD, SDCWA, SLR, and Indian and miscellaneous PPRs as set forth in Exhibits A and B hereto. Colorado River water acquired by CVWD in any transaction to the extent agreed upon prior to or concurrent with the execution of this Agreement by IID and MWD and, where necessary approved by the Secretary, shall not count against this cap.

3. QUANTIFICATION OF PRIORITY 6(a)

- a. Subject to any rights that PVID may have, and except as otherwise provided under the Interim Surplus Guidelines, or under the agreements contemplated by those guidelines, the Secretary shall deliver Priority 6(a) water to MWD, IID and CVWD in the following order and consumptive use volumes: (i) 38,000 AFY to MWD; (ii) 63,000 AFY to IID; and (iii) 119,000 AFY to CVWD, or as those parties may agree to occasionally forbear.
- b. Any water not used by MWD, IID or CVWD as set forth above will be available to satisfy the next listed amount in Section 3.a. above. Any additional water available for Priority 6(a) shall

be delivered by the Secretary in accordance with IID and CVWD's entitlements under their respective Section 5 Contracts in effect as of the date of this Agreement.

4. TRANSFERS AND OTHER WATER DELIVERY COMMITMENTS

- a. The Secretary shall deliver IID's Priority 3(a) entitlement for the benefit of IID and others as specified in Exhibits A and B hereto and in the amounts and to the points of delivery set forth therein.
- b. The Secretary shall deliver CVWD's Priority 3(a) entitlement for the benefit of the CVWD and others as specified in Exhibits A and B hereto and in the amounts and to the points of delivery set forth therein.
- c. At SDCWA's election, the Secretary shall deliver water made available for SDCWA's benefit as set forth in Exhibits A and B hereto to the intake facilities for the Colorado River Aqueduct and SDCWA may then exchange up to 277,700 AFY of Colorado River water with MWD at Lake Havasu.
- d. If in any given calendar year that the use of Colorado River water in accordance with Priorities 1 and 2, together with the use of Colorado River water on PVID Mesa lands in accordance with Priority 3(b), exceeds the consumptive use amount of 420,000 AFY, the Secretary will reduce the amount of water otherwise available to MWD in Priorities 4, 5 or 6(a) by the amount that such use exceeds 420,000 AFY. To the extent that the amount of water used in accordance with Priorities 1, 2 and 3(b) is less than 420,000 AFY, the Secretary shall deliver to MWD the difference.
- e.
 1. The Secretary shall deliver to CVWD at Imperial Dam the consumptive use amount of 20,000 AFY or such lesser consumptive use amount as may be requested by CVWD of Priority 3(a) Colorado River water made available to MWD under the Agreement for the Implementation of a Water Conservation Program and Use of Conserved Water between IID and MWD dated December 22, 1988, as amended.
 2. Beginning in 2048 and in each year thereafter, the Secretary shall deliver to CVWD at Imperial Dam the consumptive use amount of 50,000 AFY or such lesser consumptive use amount as may be requested by CVWD from the Colorado River water available to MWD.
 3. When requested by MWD for the purpose of satisfying an exchange obligation to CVWD under an agreement between CVWD and MWD for exchange of CVWD's State Water Project water, the Secretary shall deliver to CVWD at Imperial Dam the consumptive use amount of 135,000 AFY or such lesser amount as may be requested by MWD.

- f. CVWD may decline to take a portion of the water to be conserved by IID for CVWD. In this event, the Secretary shall instead deliver such portion of the water to IID or MWD, or to other unspecified water users provided, further, that any such delivery to an unspecified user is, where necessary, subject to Secretarial approval.
- g. Colorado River water will be made available to MWD through forbearance under the existing priority system as a result of a proposed land management program between PVID landowners and MWD. Neither IID nor CVWD will make any claim to or object to delivery to MWD of PVID program water to the extent agreed upon prior to or concurrent with the execution of this Agreement by IID and CVWD. If the transfer of PVID program water is not implemented, then IID has agreed to transfer for the benefit of MWD/SDCWA amounts necessary to meet the minimum Benchmark Quantities as set forth in Section 5(C) of the Interim Surplus Guidelines, not to exceed 145,000 AF in the aggregate.
- h. CVWD may utilize Colorado River water outside of Improvement District No. 1 to the extent consented to and agreed upon prior to or concurrent with the execution of this Agreement by IID and MWD.
- i. Notwithstanding the transfers set forth in this section and Exhibit B, IID, CVWD, MWD and SDCWA recognize and agree that at the conclusion of the effective period of the Interim Surplus Guidelines, they shall have implemented sufficient measures to be able to limit total uses of Colorado River water within California to 4.4 million AFY, unless the Secretary determines a surplus under a 70R strategy.

5. SHORTAGES

- a. The Secretary's authority under II.B.3 of the 1964 Decree in Arizona v. California is not limited in any way by this Agreement.
- b. If for any reason there is less than 3.85 million AFY available under Priorities 1, 2 and 3 during the term of this Agreement, any water which is made available by the Secretary to IID and CVWD shall be delivered to IID, CVWD, MWD, and SDCWA in accordance with the shortage sharing provisions agreed upon prior to or concurrent with the execution of this Agreement by IID, CVWD, MWD and SDCWA.

6. TERM

- a. This Agreement will become effective upon execution of this Agreement by all Parties.
- b. This Agreement will terminate on December 31, 2037, if the 1998 IID/SDCWA transfer program terminates in that year.

- c. If this Agreement does not terminate on December 31, 2037, then this Agreement will terminate on December 31, 2047 unless extended by agreement of all parties until December 31, 2077, in which case this Agreement will terminate on December 31, 2077.
- d. The Secretary's delivery commitment to the SLR and the Districts' recognition and acceptance of that delivery commitment, shall not terminate but shall instead continue, pursuant to Section 106 of Public Law 100-675, 102 Stat. 4000 et seq., as amended.

7. INTERIM SURPLUS GUIDELINES

The Secretary finds that execution of this Agreement constitutes "all required actions" that the relevant California Colorado River water contractors are required to undertake pursuant to Section 5(B) of the Interim Surplus Guidelines. Accordingly, upon execution of this Agreement by all parties, the interim surplus determinations under Sections 2(B)(1) and 2(B)(2) of the Interim Surplus Guidelines are reinstated.

8. BENCHMARKS FOR THE STATE OF CALIFORNIA'S AGRICULTURAL USE

- a. The parties to this Agreement agree to carry out the transfers identified in Section 4 above and in Exhibit A hereto in accordance with the schedule set forth in Exhibit B hereto. Nothing in this Agreement authorizes or precludes carrying out the transfers on a timetable sooner than provided in the schedule set forth in Exhibit B hereto. The transfers in the schedule set forth in Exhibit B hereto are undertaken to allow California agricultural usage (by PVID, Yuma Project Reservation Division, IID, and CVWD) plus 14,500 af of PPR use to be at or below the Benchmark Quantities as set forth in Section 5(C) of the Interim Surplus Guidelines. Nothing in this Agreement authorizes or precludes additional transfers of Colorado River water as agreed upon prior to or concurrent with the execution of this Agreement by the Districts to meet the Benchmark Quantities as set forth in Section 5(C) of the Interim Surplus Guidelines. All determinations by the Secretary with respect to this section shall be based upon Decree Accounting. Repayment of overrun amounts shall not count toward compliance with the transfers in the schedule set forth in Exhibit B hereto or toward compliance with the Benchmark Quantities set forth in Section 5(C) of the Interim Surplus Guidelines.
- b. In the event that i) the transfers are carried out as set forth in the schedule in Exhibit B hereto or additional Colorado River transfers as agreed upon prior to or concurrent with the execution of this Agreement by the Districts are carried out and ii) California's Agricultural usage plus 14,500 af of PPR use is at or below the Benchmark Quantities as set forth in Section 5(C) of the Interim Surplus Guidelines, the provisions of this subparagraph shall apply.
 - 1. Notwithstanding the provisions of the November 22, 2002 Supplement to the 2002 Annual Operating Plan, any existing overruns in calendar years 2001 and 2002 by parties to this Agreement must be repaid within an eight-year period beginning in calendar year 2004 in

accordance with the schedule attached in Exhibit C hereto, except that in the event that any Annual Operating Plan 24-Month Study indicates that a shortage will occur within months 13 through 24, any remaining balance of the 2001 and 2002 overruns shall be fully repaid during the next calendar year. Repayment of any overruns other than from calendar years 2001 and 2002 shall be pursuant to the Inadvertent Overrun and Payback Policy identified in Section 9 below.

2. The Secretary has considered the quantification of Priority 3(a) as set forth in Section 2 of this Agreement and the water transfers set forth in the schedule in Exhibit B hereto. These water transfers were developed to assist the Districts and SDCWA to meet the provisions of Section 4(i) of this Agreement and to reduce the occurrence of future reasonable and beneficial use reviews under 43 C.F.R. Pt. 417 to unique circumstances. These water transfers are based upon water conservation activities to be implemented over the term of this Agreement. For these reasons, the Secretary does not anticipate any further review of the reasonable and beneficial use of Colorado River water by IID pursuant to the annual 43 C.F.R. Pt. 417 reviews that are conducted during the initial term of this Agreement as set forth in Section 6.b. (December 31, 2037). Should the Secretary engage in any further review of the reasonable and beneficial use of Colorado River water by IID pursuant to 43 C.F.R. Pt. 417 under this Section, the Secretary will base her decision on (i) the purpose of the quantification of Priority 3(a) and the reductions and transfers set forth on Exhibit B hereto, and (ii) the implementation of the water transfers by IID as set forth in the schedule in Exhibit B, in addition to the consideration of the factors in 43 C.F.R. § 417.3

- c. Notwithstanding any other provision of this Agreement, and in addition to any applicable provisions of the Interim Surplus Guidelines, in the event that either i) the transfers are not carried out as set forth in Exhibit B hereto or additional Colorado River transfers as agreed upon prior to or concurrent with the execution of this Agreement by the Districts are not carried out, or ii) California's Agricultural usage plus 14,500 af of PPR use is above the Benchmark Quantities as set forth in Section 5(C) of the Interim Surplus Guidelines, the provisions of this subparagraph shall apply.

1. For each District that has not implemented the water transfers to which it is a party upon the agreed upon schedule as set forth in Exhibit B hereto, the Inadvertent Overrun and Payback Policy identified in Section 9 below will be immediately suspended. During suspension of the Inadvertent Overrun and Payback Policy, for previously incurred overruns, the payback period shall be as provided in the existing Inadvertent Overrun and Payback Policy were such Policy not suspended. The Inadvertent Overrun and Payback Policy will be reinstated at such time as a District has implemented the water transfers to which it is a party upon the agreed upon schedule as set forth in Exhibit B hereto.

2. Any remaining existing overruns from calendar years 2001 and 2002 by parties to this Agreement must be repaid within a three-year period.

3. In addition to any applicable provisions of the Interim Surplus Guidelines, in the event that the transfers are not implemented in accordance with Column 23 in Exhibit B hereto, MWD shall not place any order to the Secretary for any Colorado River water otherwise available pursuant to sections 2(B)(1) and 2(B)(2) as set forth in the Interim Surplus Guidelines.

4. The Secretary anticipates that a further review of the reasonable and beneficial use of Colorado River water by the Districts will be required pursuant to the annual 43 C.F.R. Pt. 417 reviews that are conducted during the initial term of this Agreement as set forth in Section 6.b. (December 31, 2037). In any such review, the Secretary will base her decision on the factors set forth in Section 8.b.2 above as well as the basis for any District's non-implementation of the transfers set forth in Exhibit B hereto, in addition to the consideration of the factors in 43 C.F.R. § 417.3

9. INADVERTENT OVERRUN AND PAYBACK POLICY

For so long as the provisions of Section 8.b of this Agreement are applied, the Secretary will not materially modify the Inadvertent Overrun and Payback Policy for a 30-year period, absent extraordinary circumstances such as significant Colorado River infrastructure failures, and subject to the provisions of Section 5 of this Agreement. In the event that extraordinary circumstances arise, the Secretary will consult with the Districts and other interested parties before initiating any material change.

10. ADDITIONAL PROVISIONS

- a. Imperial Irrigation District v. United States of America, et al., CV 0069W (JFS) (D. Cal. filed January 10, 2003) (JFS), is dismissed pursuant to Stipulation under Fed. R. Civ. P. 41(a)(1). Nothing in this Agreement shall affect the preclusive and non-preclusive effects of the Stipulation during the term of this Agreement and thereafter.
- b. Upon dismissal of Imperial Irrigation District v. United States, et al., as provided in subsection 10(a) above, the Secretary will irrevocably terminate the *de novo* "Recommendations and Determinations Authorized by 43 C.F.R. Pt. 417, Imperial Irrigation District" for 2003, and IID's water order for 2003 is approved subject to the terms of this Agreement.
- c. 1. IID, CVWD, MWD, and SDCWA do not agree on the nature or scope of rights to the delivery, use or transfer of Colorado River water within the State of California. Furthermore, the Districts and SDCWA agree not to use this Agreement or any provision hereof, as precedence for purposes of evidence, negotiation or agreement on any issue of California or federal law in any administrative, judicial or legislative proceeding, including without limitation,

any attempt by IID and SDCWA to obtain further approval of any water transaction.

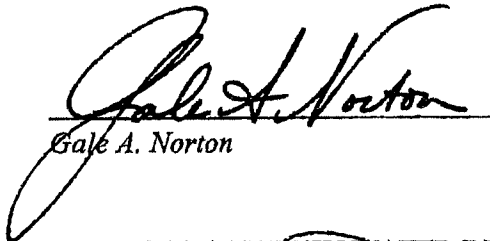

2. The terms of this Agreement do not control or apply to the nature or scope of rights to the delivery, use or transfer of Colorado River water within the State of California, except as those rights are defined and addressed in this Agreement during the term hereof.

3. By executing this Agreement, the Districts and SDCWA are not estopped from asserting in any administrative, judicial or legislative proceeding, including those involving the United States, that neither this Agreement nor any of its terms was necessary or required to effectuate the transactions contemplated herein.

4. Nothing herein waives the ability of any party to challenge the exercise of particular miscellaneous and Indian PPRs.

- d. This Agreement shall not be deemed to be a new or amended contract for the purpose of Section 203(a) of the Reclamation Reform Act of 1982 (Public Law 97-293, 93 Stat. 1263).
- e. This Agreement does not (i) guarantee or assure any water user a firm supply for any specified period, (ii) change or expand existing authorities under applicable federal law, except as specifically provided herein with respect to the Districts, (iii) address interstate distribution of water; (iv) change the apportionments made for use within individual States, (v) affect any right under the California Limitation Act (Act of March 4, 1929; Ch. 16, 48th Sess.), or any other provision of applicable federal law.
- f. This Agreement is not intended nor shall it be construed to create any third party beneficiary rights to enforce the terms of this Agreement in any person or entity that is not a party.
- g. Each party to this Agreement represents that the person executing this Agreement on behalf of such party has full power and authority to do so, and that his/her signature is legally sufficient to bind the party on whose behalf he/she is signing.
- h. This Agreement shall remain in full force and effect according to its terms regardless of whether the Interim Surplus Guidelines are in effect or terminated.
- i. This Agreement with the United States is subject to and controlled by the Colorado River Compact of 1922.

Exhibit A: Delivery of Priority 3(a) consumptive use entitlement to the Imperial Irrigation District and the Coachella Valley Water District

Imperial Irrigation District

The Secretary of the Interior shall deliver Imperial Irrigation District's Priority 3(a) consumptive use entitlement under this Colorado River Water Delivery Agreement, pursuant to this Exhibit A and Exhibit B hereto as follows:

Delivered to (entity):	At (point of diversion):	Amount not to exceed (af):	Notes
CVWD	Imperial Dam	103,000	---
MWD	Lake Havasu	110,000	1
SDCWA	Lake Havasu	56,200	2
SDCWA	Lake Havasu	200,000	3
SLR	<i>see note 4</i>	<i>see note 4</i>	4
Misc. & Indian PPRs	Current points of delivery	11,500	5
For benefit of MWD/SDCWA	Lake Havasu	145,000	6
IID	Imperial Dam	Remainder	---
IID's Priority 3(a) Total		3,100,000	---

Notes to Imperial Irrigation District:

1. Agreement for the Implementation of a Water Conservation Program and Use of Conserved Water, dated December 22, 1988; Approval Agreement, dated December 19, 1989. Of amount identified: up to 90,000 af to MWD and 20,000 af to CVWD.
2. Water conserved from the construction of a new lined canal parallel to the All-American Canal from Pilot Knob to Drop 3.
3. Agreement for Transfer of Conserved Water, dated April 29, 1998, as amended. As set forth in Exhibit B, delivery amounts shall be 205,000 AF in calendar year 2021 and 202,500 AF in calendar year 2022.
4. Water conserved from All-American Canal lining project and made available for benefit of San Luis Rey Settlement Parties under applicable provisions of Pub. L. No. 100-675, as amended. Quantity may vary, not to exceed 16,000 afy, as may the point of diversion, subject to the terms of the Allocation Agreement.
5. Water to be delivered to miscellaneous and Indian PPRs identified in the Decree in Arizona v. California, as supplemented. The delivery of water will be to current points of delivery unless modified in accordance with applicable law.
6. As provided in subsection 4(g) of this Agreement.

Coachella Valley Water District

The Secretary of the Interior shall deliver Coachella Valley Water District's Priority 3(a) consumptive use entitlement under this Colorado River Water Delivery Agreement pursuant to this Exhibit A and Exhibit B hereto as follows:

Delivered to (entity):	At (point of diversion):	Amount not to exceed (af):	Notes
SLR	<i>see note 1</i>	<i>see note 1</i>	1
SDCWA	Lake Havasu	21,500	2
Misc. & Indian PPR	Current points of delivery	3,000	3
CVWD	Imperial Dam	Remainder	---
Coachella Valley Water District's Priority 3(a) Total		330,000	---

Notes:

1. Water conserved from Coachella Canal lining project and made available for benefit of San Luis Rey Settlement Parties under applicable provisions of Pub. L. No. 100-675, as amended. Quantity may vary, not to exceed 16,000 afy, as may the point of diversion, subject to the terms of the Allocation Agreement.
2. Water conserved from lining the unlined portion of the Coachella Canal.
3. Water to be delivered to miscellaneous and Indian PPRs identified in the Decree in Arizona v. California, as supplemented. The delivery of water will be to current points of delivery unless modified in accordance with applicable law.

¹ Exhibit B is independent of increases and reductions as allowed under the Inadvertent Overrun and Payback Policy.

² Any higher use covered by MWD, any lesser use will produce water for MWD and help satisfy ISG Benchmarks and Annual Targets.

⁴ Ramp-up amounts may vary based upon construction progress, and final amounts will be determined by the Secretary pursuant to the AFN.

⁵ Ramp-up amounts may vary based upon construction progress, and final amounts will be determined by the Secretary pursuant to the Allocation Agreement.

⁶ Water would be transferred to MWD subject to negotiations with the Colorado River Water Conservation District.

Water would be transferred to MWD subject to satisfaction of certain conditions and to appropriate federal approvals. For informational purposes only, these transfers may also be subject to state approvals. Schedules are subject to adjustments with mutual consent. After 2006, these quantities will count toward the ISG Benchmarks (column 22) and Annual Targets (column 23) only if and to the extent that water is transferred into the Colorado River Aqueduct for use by MWD and/or SDCWA.

^a MWD has agreed to provide transfer amounts to meet the minimum ISG benchmarks and to ensure additional agricultural reduction to help satisfy the ISG Benchmarks and Annual Targets. MWD will provide CVWD 50,000 AFY of the 100,000 AFY starting in year 46.

⁹ Up to the amount shown, as agreed upon reduction to IID as CMAQ transfer amounts are received. IID has agreed to provide transfer amounts to meet the minimum ISG benchmarks, not to exceed a cumulative total of 145,000 AF. Maximum transfer amounts are 25,000 AF in 2006, 50,000 AF plus the unused amount from 2006 in 2009, and 70,000 AF plus the unused amounts from 2006 and 2009 in 2012. In addition to the maximum transfer amounts IID has also committed that no more than 72,500 AF of reduced inflow to the Salton Sea would result from these additional transfers.

¹⁰ For purposes of Subparagraph 8(b)(2)(i) and (ii) and 8(c)(1) and (4) the Secretary will take into account "all" PPRs, including but not limited to the PPRs that are subject to the reduction described in this paragraph.

For purposes of Subparagraph 8(b)(2)(i) and (ii) and 8(c)(1) and (4) the Secretary will take into account: (i) the satisfaction of necessary conditions to certain transfers (columns 7 and 9) not within IID's control; (ii) the amounts of conserved water as determined, where such amounts may vary (columns 4, 6, 9 and 10); and (iii) with respect to column 7, reductions by IID will be considered in determining that the amount of water conserved is sufficient to meet the requirements of the Act.

¹¹ For purposes of Subparagraph 8(c)(1) and (4) the Secretary will take into account: (i) the satisfaction of necessary conditions to certain transfers (columns 15 and 16); (ii) the amount of conserved water as

and (ii) the amounts of conserved water as determined, where such amounts may vary (column 15).

13 All-consumptive use of priorities 1 through 3 plus 14,500 AF of PPRs must be within 25,000 AF of the amount stated.

¹⁴ Assumes SDCWA and HD mutually represent.

Notes:

Substitute transfers can be made provided the total volume of water to be transferred remains equal or greater than amounts shown consistent with applicable federal approvals. The shaded columns represent amounts of water that may vary.

Exhibit C: Payback Schedule of Overruns for Calendar Years 2001 and 2002

<i>Year</i>	<i>IID</i>	<i>CVWD</i>	<i>MWD</i>	<i>Total</i>
2004	18,900	9,100	11,000	39,000
2005	18,900	9,100	11,000	39,000
2006	18,900	9,100	11,100	39,100
2007	18,900	9,100	11,100	39,100
2008	18,900	9,200	11,100	39,200
2009	18,900	9,200	11,100	39,200
2010	19,000	9,200	11,100	39,300
2011	19,000	9,200	11,100	39,300
Cumulative	151,400	73,200	88,600	313,200

Note: Each district may, at its own discretion, elect to accelerate paybacks to retire its payback obligation before the end of the eight-year period ending in calendar year 2011. Each district's payback obligation is subject to acceleration in anticipation of a shortage in the Lower Colorado River Basin as provided for in section 8(b).
